Feds sound Red alert on data

Strict measure lacks definition, critics claim

By Mitch Betts
WASHINGTON, D.C. —

The Reagan administration has ordered all federal agencies to identify sensitive information held in government computers — including a broad range of economic, technical and personal data — that must be protected with stringent computer security measures.

The policy reflects the administration's view that government computers and data communications need increased security to protect them from penetration or interception by foreign adver-

saries such as the Soviet Union, as well as domestic hackers, criminals and terrorists, government sources said.

But critics said the definition of sensitive information is too expensive and will lead to restrictions on access to government information by U.S. citizens.

John M. Poindexter, the president's national security advisor, issued a policy memo earlier this month defining a new category of "sensitive but unclassified" government information that must be protected from disclosure or tampering.

In addition to unclassified information about national defense and foreign policy, the new category covers "economic, human, financial, industrial, agricultural, tech-

nological and law enforcement information" stored in government computers. Also covered are confidential personal information and commercial proprietary information supplied to the U.S. government.

According to testimony at congressional hearings last year, sensitive information might include such government data as files on hazardous materials transportation, Federal Reserve monetary policy, flight safety, Securities and Exchange Commission records and Social Security Administration records.

"This definition is overly broad, way beyond national security," said Jerry J. Berman, legislative counsel at the American Civil Liberties Union last week. "Although

IBM stirs 386 stew with user prototypes

By Douglas Barney
Reports of early sightings of IBM 80386-based prototypes last week have added intrigue to the growing controversy swirling around IBM's strategy

for asserting its dominance in the microcomputer market.

Some industry watchers say IBM is being forced to hasten the announcement of its own micro based on the speedy Intel Corp. 80386 chip because of the early success of its competitors' 80386-based machines. Compaq Computer Corp. last week announced the sale of its 10,000th Deskpro 386 unit, indicating that at least some users are refusing to wait for an IBM machine.

The Compaq machine was introduced in September. IBM is facing a critical juncture in its dominance of the microcomputer market. To fight the loss of market share to clone makers, IBM's 386 generation will require certain proprietary features. Such features take time to develop and have prompted speculation that an IBM 386 machine is up to a year away.

However, waiting that long presents a risk that IBM

ISDN passes first real-world test

By Elizabeth Horvitz

PHOENIX — After at least five years of development work and prototyping on vendors' premises, the first operational Integrated Services Digital Network involving customer premises equipment was successfully tested last week.

In two initial tests, Arizona government officials transmitted both voice and data between their offices through a Northern Telecom, Inc. ISDN digital switch residing on Mountain Bell's

Phoenix central office.

One of several prototype ISDN networks that have been planned during the next few months by regional holding company U.S. West, the trial "is important because its first-time customers get their hands on ISDN technology for real-world applications," said Howard Garvey, Northern Telecom Integrated Network Systems' vice-president of marketing.

The trial also offers participating vendors the opportunity "to evaluate ISDN

technology and determine customer benefits outside the research lab," said Mountain Bell Marketing Vice-President Bob Hawk. Customer premises equipment used in the trial is still in the prototype phase, however. No time frames for introducing commercial offerings were discussed.

In the first of two ISDN applications demonstrated at a news conference, Don Cline, Mountain Bell's Arizona vice-president and chief

CW SPECIAL REPORT

Answering skeptics, DB2 thrives in production systems

By Charles Babcock

DES MOINES, IOWA — It's after its parts inventory system. The Port Authority of New York and New Jersey uses it for human resource applications. American Hoechst Corp., a New Jersey pharmaceutical firm, uses it for a production tracking system.

All three rely on DB2, IBM's relational data base management system, for production systems, and they are typical of a growing number of IBM customers, despite skepticism that DB2 is not ready for such tasks.

IBM now advocates that

DB2 be put into production use, having launched it as an information center-type product. But more significantly, corporate users are finding they cannot get to where they want to go without a DBMS with relational qualities. In that fledgling field, DB2 is selected by many as the safest bet.

Just how far the production use of DB2 has advanced is difficult to say, but several observers say it began to grow after the 10% to 25% performance boost in Release 2 last February.

"We saw a fair amount of

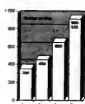

activity last year," says Nancy K. Mullen, Arthur Andersen & Co.'s manager of data base consulting at the company's Chicago headquarters. Since Release 2, "there has been an explosion of activity," she says.

"I get a very strong sense that companies are putting important applications — payroll, personnel, benefits — onto DB2," says Elizabeth Dahab, a member of the steering committee of the Knaier DB2 User Group in New York and a DB2 consultant at The Port Authority.

IBM tries parallel processing

Accelerator focus of multiprocessing effort

By James A. Martin

FORT LAUDERDALE, Fla. — Limited details of IBM's 4-year-old parallel processing research effort were aired last week as company officials described how they are examining the potential and pitfalls of that technology.

Officials of IBM's Engineering Design Systems (EDS) division have been developing a hardware accelerator to speed communications among microprocessors via multiple data buses without sacrificing each processor's performance. Speaking at the 11th annual IBM University Study Conference here, the engineers said they hope to improve their understanding of the complexities of multiprocessor environments.

EDS has been working on the hardware accelerator project to determine how it can bring as much power as possible to the design workstation. There are no plans, however, to develop any specific products from this experiment, according to Roger E. Peo, EDS advisory engineer.

"Design automation problems are growing faster than mainframes," Peo said. "We wanted to build an accelerator with high-performance capacity, one that was flexible enough so we could look at the entire spectrum of problems that logic designers face."

A goal in the project was to develop an accelerator that offered efficient random-access memory (RAM) address space and minimal response time between data buses. The accelerator consisted of standard parts

such as 17 Motorola, Inc. 68010 microprocessors so that EDS developers would be free to use conventional programming tools, Peo said.

Although communications between processors is necessary to take full advantage of parallel processing, those communications slow the processors' speed, which at optimum level is less than 1 million instructions per second. As a result, each processor requires at least 2M bytes of RAM in order to maintain speed.

Instead of an operating system, the accelerator uses a monitoring system that acts as a management resource. "We wanted to send and receive messages between processors and establish the configuration of the accelerator. The user, with this monitor, can tell how many processors are available on the accelerator," Peo said.

Although Peo would not elaborate on software application programs developed for the accelerator, he said such programs were designed using object-oriented programming, which enables users to break one job into many and send those tasks to different processors. Being able to distribute tasks from one job to multiple processors is the key advantage of parallel processing, Peo added.

Although the majority of IBM research projects outlined at the conference are not scheduled to become products, research and development is vital to U.S. companies and should be a major vendor focus, attendees said. "With technology changing every six months, it's worth it to experiment as much as possible," said Nils Sedwick, academic center support coordinator for Cal Poly, formerly California Polytechnic State University in San Luis Obispo.

High tech, universities find joint projects help both stay competitive

By Amy Sommerfeld Price

FORT LAUDERDALE, Fla. — Forming a close partnership between a university and industry in computing research can mean the difference between technology leadership and obscurity for both the company and the college.

That was the theme of the 11th annual University Study Conference, held here by IBM's Academic Information Systems (AIS) group last week.

The conference brought together representatives of more than 300 universities from 36 states and seven foreign countries to show off the latest in university computing techniques.

"The need to stay competitive applies to universities as well as industry," said George B. Betzel, IBM senior vice-president in charge of AIS. "In the 1980s, institutions of almost every kind are... compelled to compete in the market in order to survive."

Competitive position

"Technology is a clear player in giving these universities an advantage," said John Daily, general manager of AIS. Universities and col-

leges do not measure their competitive positions in terms of market share or the bottom line the way a business does but gauge their success by the quality of students and faculty they can attract, according to Daily.

"Traditionally," Daily explained, "A faculty candidate would ask, 'How big would my lab be? What equipment would I have?' Now they ask the same questions but also, 'How much computer equipment comes with the lab? How many personal computers are here? How many terminals are networked? Will I have access to a supercomputer?'"

IBM's AIS arm funded much of the research presented at the conference through unrestricted grants and joint study programs, in which IBM contracts with the university for a specific research project and supports the work with equipment and cash.

Among the projects presented at the study conference were an expert system for configuring local-area networks, a programming language for natural language processing and an environment for developing portable academic software on 32-bit workstations.

BETTER SOFTWARE. IT'S A LOT CHEAPER THAN MORE HARDWARE.

Today, managers are asking corporate computer systems to answer the questions they need answered before they make important decisions. And only 4th generation languages and relational data base management systems (DBMS) can give them those answers.

But according to IBM, if you want this new software, you'll probably need to upgrade to their biggest operating system and buy more hardware. Because DB2 won't run on every IBM system and will only run efficiently on their biggest systems.

That's why many companies are buying ADR* software instead.

You see, ADR/IDEAL*, our 4th generation application development system, and ADR/DATACOM/DB*, our high performance relational DBMS, will probably run on the IBM system you already have.

So although ADR software costs more, it ends up costing a company a lot less.

And managers won't have to wait for critical applications. They're written and running in a matter of days instead of months. On average, 10 to 15 times faster than COBOL. Because IDEAL automates the programming process.

And they get the information they need when they need it. They have immediate access to the same current information all the departments use. Because DATACOM/DB is flexible enough for end-users to use and still delivers high volume production performance.

So ADR can give you all the benefits of the new relational software, more than likely on the IBM hardware you're using now. Even though IBM can't.

And the reason for that shouldn't surprise you. After all, ADR isn't in the hardware business.

For more information about ADR software, call 1-800-ADR-WARE. Or mail us the coupon.

SRB CPU Time: 77%

SOFTWARE Tracks Used: 26%

syncsort
INC.

Here we go again—Improving the Sorting Breed!

That sleek young thoroughbred out in our main paddock is SyncSort OS, Release 3.0. It's by SyncSort 2.5 out of that celebrated brood mare, High Technology. And it's destined to win a lot of prizes on MVS and MVS/XA tracks.

IMPROVING THE UNIMPROVABLE: Until now, SyncSort 2.5 was the best OS sort program ever bred. And it was the easiest to use, too—thanks to a tack-room full of advanced features.

SyncSort 2.5 probably could have continued to win prizes for years. There was only one catch—it wasn't good enough for us.

PICKING TOMORROW'S WINNERS: We knew that the extended virtual storage available under MVS/XA offered an unprecedented opportunity for the evolution of SyncSort OS. New sorting techniques and a powerful new virtual storage facility—DSM/XA—make speedy SyncSort 3.0 the winner in the MVS/XA derby.

FASTER SORT PERFORMANCE: Advanced sorting technology lets SyncSort 3.0 outperform the competition in race after race. You can expect savings in critical resources over SyncSort 2.5 up to those shown at lower left. And that can add up to a big increase in total systems throughput.

PROGRAMMER PRODUCTIVITY FEATURES: As any seasoned sort-watcher knows, there's a lot more to data handling than sorting. Thousands of 2.5 users cheered the Data Utility features that let them create multiple output, write reports, select records and format data in virtually any form. These versatile features have been expanded in SyncSort 3.0 for even greater flexibility.

- **Multiple Output**—From a single sorted file, you can create multiple files and reports. Each can include the same or different data and can be written to the same or different devices.
- **SortWriter**—A powerful tool can produce extensive reports as a by-product of your normal sorting—without user exits and the associated programmer investment. Headers, trailers, sections, total, subtotal and record count capabilities provide flexible formatting.
- **Record Selection and Formatting**—Enhanced features let you select records, delete and reposition fields, insert literals, convert and edit numeric data, and summarize numeric fields.

If you're tired of betting on sort programs that empty your pockets of resources and are tough to handle, give us a call. We'll arrange to have SyncSort OS 3.0 run a few furlongs on your own turf.

Syncsort Incorporated 50 Tice Boulevard, Woodcliff Lake, NJ 07675

ISDN passes real-world test

From page 1

executive officer, placed a five-minute voice call at the Phoenix Civic Plaza to Arizona Secretary of State Bruce Mofford and simultaneously transmitted a certificate commemorating the event. The transmissions were handled by Northern Telecom's Meridian digital telephone sets and workstations and passed through a Northern Telecom DMS-100 ISDN switch at Mountain Bell's Phoenix central office.

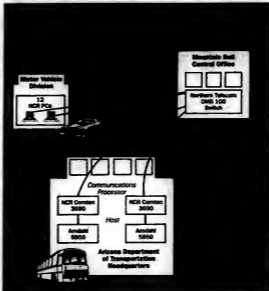

In the second ISDN application, John Amidon, deputy manager of information systems of operation for the Arizona Department of Transportation, used an NCR Corp. personal computer to access and alter a driver's record residing on an Amdehl Corp. 6860 host in the Motor Vehicles Division building two blocks away (see diagram).

A prototype ISDN interface from NCR enabled the PCs to transmit requests over a basic 64K bit/sec. ISDN line through the Mountain Bell ISDN switch and to NCR Contem, Inc. 3690 front ends for two Amdehl hosts. The 3690s are also equipped with ISDN interfaces that translate the ISDN Basic Rate to ES-232 protocols.

Technology benefits

A major Mountain Bell customer, the state government of Arizona, decided to accept the divested Bell operating company's invitation to participate in an ISDN trial "less because of ISDN's future as a standard, which will be a long time coming, than because we thought the technology might benefit us," Amidon said.

Sending both voice and data in digital form over the same twisted-pair telephone "wiring" is "more reliable than analog communications and in

the long run will save us a lot of money," he added. Workstations linked over an ISDN basic interface "can be moved as easily as you can move telephones, as opposed to having to re-string coaxial cable," he added.

During the six-month ISDN trial, 12 PCs at the Motor Vehicle Division, which are now hard-wired to the Amdehl hosts via NCR Contem communications controllers, will be replaced by NCR PCs that will access the hosts via a link to Mountain Bell's ISDN switch, Amidon said. The department also plans to install AT&T digital telephones that can use the same

ISDN links "since the motor vehicle people often have to deal with the public over the phone," he added.

During the January-February time frame, the department plans to connect IBM Personal Computers at a remote construction site to the Amdehl hosts at headquarters via a dual link: first to Mountain Bell's OC1T X.25 packet-switched network and from there to the divested Bell operating company's ISDN switch over the D channel reserved for data packets.

The advantage here is the ISDN basic interface's ability to transfer data at 64K bit/sec. "Currently we

use 2,300 bit/sec. telephone line connections, which are much too slow," Amidon said.

NCR Contem is taking part in the ISDN prototype "so that we can develop hands-on expertise working with users, carriers and other equipment suppliers in the ISDN environment," said company spokesman Barry Carmichael.

The company has no immediate plans to develop commercial ISDN interfaces "until user demand, services and terminal equipment are there," said NCR Contem senior systems engineer Richard Schwarz. "The window should open around 1988, after most field trials are concluded," he added.

Third trial

In a third Mountain Bell-sponsored ISDN trial, scheduled to begin in late December or early January, Honeywell, Inc. executives working at home will access their company's host systems through a GTE Corp. GTD6EAX ISDN switch residing at a Mountain Bell central office.

The trial involves the basic ISDN interface, which was designed primarily for workstations and is composed of two 64K bit/sec. B channels to carry voice or data and one 16K bit/sec. D channel for signaling and packet-switched data.

Another trial, sponsored by Ameritech's operating company Illinois Bell, that is scheduled to begin Dec. 16 will involve both the basic and primary ISDN interfaces. The primary interface, which defines 23 B channels and one D channel, is used most often for higher speed applications such as host-to-host and host-to-private branch exchange connections.

The trial will link a variety of data and voice equipment at three McDonald's Corp. sites via an AT&T ISDN 5838 central office switch in Oak Brook, Ill., an Illinois Bell spokesman said.

Exec promises angry users IBM to improve office systems

By Donna Raimondo

HOUSTON — Confronted with charges that IBM office systems do not work efficiently, company officials promised a range of added functions during a debate at an office systems seminar here last week.

"I have been trying to implement Displaywrite 36 for the office for 15 months now," one user said. "I have a half million dollars' worth of equipment that I have had to get aside."

Tony Mondello, vice-president of software development and office systems with IBM Information Services, said IBM will provide consistent user interfaces across its Personal Computer, System/36 and 370 architectures, added office functionality and ease of learning and use for users.

Mondello spoke to about 260 vendors, analysts and users at the "Future Strategies in the Office" seminar hosted by Rossi Consultants of Marblehead, Mass., and

Houston's Innova office technologies and design center. The seminar gave nine major office vendors a platform for describing future office systems, but user and analyst interest was clearly focused on IBM.

"How many years?"

"I heard your strategy five months ago, but I don't hear anything like that when I call the support hot line," said the user, who later declined to be identified or to expand on her situation. "How many years down the road is it?"

Mondello promised more integration of the Personal Computer with the System/36 and 370 architectures and improved ways to integrate them during 1987. But he indicated that the user might have to wait for correction of an "embarrassing" printer snafu that prevented the user from printing out certain kinds of formats.

"You will have a list of functions that won't be

ready in six or 12 months, and I know you won't be happy with that. But PC integration is the first step. We will implement the strategy," Mondello said.

When asked if IBM would close the PC architecture, Mondello said, "Do you really think we would do that? The IBM PC is the industry, and we benefit from not closing it. . . . We created that industry. We are not about to screw it up."

"At least one analyst was not convinced. 'I believe IBM will close its architecture to the new development but allow users to run old applications on future PCs,' said Jerry Eisen, president of Office Science International."

Users and analysts also questioned IBM officials about the awkwardness of using Distributed Office Support System (Dioses) and the lack of compatibility in its mid-range systems.

Dioses is difficult to understand and is a resource hog that a lot of users do not

want on their systems, said Molly Upton, vice-president of applied technologies at International Data Corp. In answer to her plea for a more palatable Dioses implementation, IBM indicated that would happen.

"We have to make it more palatable because it is the backbone for our library distribution services," Mondello said. IBM will give Dioses better performance and more usable functions. "There is no secret technology that will jump up here. Dioses is it. There are problems, and we have to fix them, but Dioses is the base we are going with," he added.

Alternative to Dioses

One company at the seminar attended in hopes of finding an alternative to Dioses. "We have IBM 8100s that IBM dropped. Although we are traditionally an IBM shop, we are afraid to implement Dioses because of its difficulty," the office automation manager said.

While IBM is the environment other vendors must be compatible with, users may not need to be IBM compatible, said Rudy Strobl, senior management consultant at Arthur D. Little, Inc. "It is a myth that everything has to talk to everything else in your shop," he said. Users should adopt the attitude that they are the office systems industry's driving force, Strobl said. "The user has to get what he wants or not buy," he added.

In the integration of vertical market applications into office systems, IBM does not even figure at this point, Strobl said. Although Digital Equipment Corp. is clearly ahead and Wang Laboratories, Inc. and Data General Corp. are making good progress, IBM's 9870 makes Big Blue best positioned in the long term because users will have access to the mainframe through the VM operating system and access to PC applications through DOS, he added.

NEWS

Starlan clears highest hurdle in gaining IEEE approval

Scheme now looms as networking standard

By Jeffery Butler

SAN DIEGO — Starlan last week passed perhaps its severest test en route to becoming an official industry standard when the networking scheme won unanimous approval from the Institute of Electrical and Electronics Engineers' (IEEE) 802.3 working group.

By a 34-to-zero margin with no abstentions, group members voted to endorse a recently amended draft of the proposed Starlan standard and recommended that the document move another step toward ultimate acceptance.

The proposed IEEE Starlan standard defines an unshielded twisted-pair version of the 802.3 networking protocols that use carrier-sense multiple access with collision detection as a media access method. Supporting data rates of 10 Mb/sec, the network is considered a low-cost, lower speed alternative to 100 Mb/sec, coaxial cable-based 802.3 networks, which, unlike Starlan, require the installation of special wiring.

Despite the fact that the IEEE still has not given final approval to Starlan specifications, several vendors have already introduced Starlan products. AT&T announced its version of Starlan in March 1985, and Hewlett-Packard Co. announced Starlan support two weeks ago [CW, Nov. 10].

The Nov. 20 vote, which coincided with the group's third and final 1986

plenary meeting, came just two days after the One Base Five working committee approved its latest revisions to the draft Starlan standard.

Of the 66 committee participants who cast ballots, all but five expressed satisfaction with how the body has responded to questions that some of its own members have raised recently about the proposed standard's technical content. Three of the voters abstained, while two others dissented.

Despite scoring twin victories in swift succession, Starlan still must gain the blessing of two additional IEEE-affiliated organizations before it can qualify as an industry standard. The first such entity is the

Technical Committee for Computer Communications (TCCC), which is expected to announce its decision in March when the next plenary session will convene in New Orleans.

If the networking scheme gets past the TCCC, it will then go before the IEEE Standards Board, which will probably decide Starlan's fate when it holds its next meeting in June.

Even though the proposed standard still faces at least another six months of continued scrutiny, its passage through both the 802.3 working group and One Base Five constitutes a major step toward final adoption.

"Getting to the working group is the biggest hurdle that Starlan has to

overcome on the way to formal approval as a standard," according to Bob Galin, who chairs a key 802.3 task force. "History proves that once a proposed standard emerges from a working group, its chances of acceptance rise to about 90%."

Although the lopsidedness of the IEEE's latest balloting may have been a bit surprising, the working group's endorsement of the Starlan standard was far from unexpected. Most of the group's participants represent vendors that have either already announced Starlan products or expect to do so soon, Galin said. So members were unlikely to reject a networking standard in which their employers have a vested interest.

Try ABR

Innovation's Automatic Backup & Recovery System

Free for 90 Days

Incremental Backup — Backup of changed data sets.

Archiving & Superscratch — ABR will automatically backup and scratch data sets off disk and keep track of the data sets in its own data base.

Automatic Recall — Of Archived data sets under TSO or batch jobs.

Compression Option — Backup of Archived data sets in a COMPRESSED format.

DASD Management Report

- Backup and Archive report
- Wasted space report
- Generalized report writer..format your own report
- Extensive ICF VSAM reporting

Unlike device support, ISPF panels and much more...

1500 Users — Most widely used MVS disk management system

Performance — ABR is the fastest DASD management system. ABR will use less system resources than any other system.

COST — ABR is \$8,500 (perpetual license) for one CPU for existing FDR/COMPACTOR customers. Non FDR/COMPACTOR customers, total cost is \$16,500 (perpetual license).

Available for IBM VSI, MVS and MVS/XA systems.

Performance, box size stifle PC XT Model 286 demand

By David Bright

Although IBM claims its Personal Computer XT Model 286 system fills a product line gap between the XT and AT models, the system has attracted little interest since its early September introduction.

Managers give clear-cut reasons for having so far shunned the \$3,995 system: While less expensive than the AT, the XT Model 286 offers less performance. Furthermore, most boards built for the AT simply will not fit into the XT Model 286's smaller XT-size box.

An office systems manager at a Southern California aerospace company suggests that the XT Model 286 was a blunder on IBM's part. "The turkeys made the guts a different size," he exclaims. "The case is too short. Who needs the aggravation for the few bucks that you save? We've already got the ATs pretty well inte-

grated into our product line, and rather than fiddle around with yet another device, we'll stick with what we have."

A personal computer system manager at another strong IBM shop stresses that price and performance are two separate issues. According to Ed Macchio at Northrop Corp.'s Defense Systems Division in Rolling Meadows, Ill., the machine's lower performance is a negative, and the board issue raises too many unanswered questions, such as compatibility with existing ATs and vendor support and supply as well as add-on boards' effect on existing software.

"I can't imagine why anyone would buy [the XT Model 286]," says John McCarthy, research manager at Forrester Research, Inc. in Cambridge, Mass. "It was too little, too late — one of the fluff announcements of the year."

The XT Model 286 comes with a 6-MHz Intel Corp. 80286 zero-wait state processor, a 20M-byte hard disk drive with an 85-nsec average access time and a 167W power supply. In comparison, the \$5,295 AT includes an 8-MHz, one-wait state 80286, a 20M-byte hard disk drive and a 182W power supply.

At a recent meeting, the Chicago Association of Microcomputer Professionals discussed the XT Model 286. Little interest was shown, says consultant Julian Horwich, and most members indicated that they would stick with ATs or equivalent machines. At his company — a large pharmaceutical firm — Horwich says the XT Model 286's lower price is not enough to make up for the accompanying performance trade-offs of sacrificing disk speed and possibly encroaching board problems.

A Computerland Corp. spokesman

agrees that the XT Model 286 is not selling up to IBM's expectations. According to an IBM spokesman, however, Big Blue is "pleased with the reception that customers have given the XT 286."

In case the XT 286 or a succeeding Intel 80286-based machine with the same form factor does start to sell, vendors of add-in boards have begun making boards that fit both the XT 286 and the AT. Two such vendors are Iteconics, Inc. and AST Research, Inc., which both recently offered multi-function cards.

Tony Paradiso, multifunction products marketing director at AST, says that AST plans to eventually shrink all of its AT boards to the XT Model 286 size factor. The reason is to "insure ourselves" in case IBM comes out with another 80286-based machine using the XT Model 286's form factor, he adds.

IBM stirs stew with prototypes

From page 1

would lose a controlling position in the 386 market, as users enamored with the current 386 offerings from Compaq and others buy in larger volumes.

Competing vendors have been hoping to establish a de facto standard for 386 machines prior to an IBM introduction, but the appearance of IBM prototypes could hinder those efforts.

Users, vendors and analysts claim that IBM has established nondisclosure relationships with a select group of end-user sites and key microcomputer software developers in order to show early prototypes of an Intel

80386-based machine.

IBM is showing the machines even though it has still not determined their ultimate configuration, sources say.

They indicate that IBM is still grappling with the issue of a possible custom 80386 processor and with the decision to offer a proprietary operating system. Another issue involves the complexity of networking between the IBM machine and the firm's larger systems, sources say.

Some sources, such as the head of an influential group of personal computer users, say that IBM is distributing several "early alpha" prototypes of an 80386-based machine to a highly select group of beta testers, including large software and networking vendors, as well as a small handful of large end-user sites.

That source says a January announcement of such a machine is possible, although most industry sources and analysts are predicting a mid-year announcement, with one lone analyst contacted calling for a 1988 announcement.

Another source refers to the machines as simply experimental.

"Five or six prototypes"

Sources caution that the final version could differ radically from prototypes. "There are several, maybe five or six, prototypes, and IBM is making a number of changes to these machines," says George F. Colony, president of Forrester Research, Inc., a Cambridge, Mass.-based consulting firm.

Colony says some users have been briefed by IBM officials about the machine.

"There is more than one prototype out. Everybody is looking at the 386 prototype, but IBM still has a proprietary system that is being shown around, at least internally at IBM," says Claire Fleig, an analyst with Los Altos, Calif.-based International Technology Group, a research and consulting firm.

She adds that the proprietary system is based on an IBM 370 architecture chip and that IBM is also working on a System/36 microprocessor.

"There is no guarantee that because people are seeing this machine that this will be the final form it will be in when it's announced. They

could use the 386 as a secondary processor for specific functions and use another one as the central CPU and still have compatibility with existing software," Fleig says.

"It is a perfect time for IBM to make a break. All of these people like the Tandys and the Televids continue to say, 'We are compatible,' but you can't be compatible with something that doesn't exist," Fleig says.

Despite the lack of a final configuration, an early look at prototype machines is a great help for vendors writing software to run on the new machine, one user says.

He adds that a variety of prototypes does not create problems as long as items such as memory size, number of slots and storage devices remain essentially the same.

IBM machine on the way

Other sources say an IBM 386 machine may be a long way off but, nonetheless, is on the way. "I've got to believe there are three or four groups at IBM doing 386-based machines, and I wouldn't be surprised if they don't even know which one to release and when," says Ed Belove, vice-president of research and development for Lotus Development Corp.

"IBM isn't going to ship until they have a good history of production on that chip. IBM, rightly so, is very conservative about single-sourced chips of that complexity. And right now, what happens if the Intel 386 line has a glitch in it? That happens in the semiconductor business."

"I think they're going to want to see some reasonable time period of flow and probably a second source — whether it's internally second-sourced or externally," Belove says.

Other factors may hold back an IBM move into 386 territory. "There's two things that are going to hold them up. One, why do they need it? There's no compelling reason for them to announce a 386 unless they have something really unique and exciting."

"And until there's the next-generation operating system. Those two go hand in hand. I would assume IBM wants to ship them together," Belove says.

Computerworld senior writers David Bright and Eddy Goldberg contributed to this report.

If You Can't Choose Between IRMA And IBM, Don't.

Choose the Businessland® 3270 Adapter, instead.
So you can use all the software you've been running
with your IRMA® card. And all the software coming from
IBM® for its 3278/79 card.

Without having to choose between the two.

The Businessland 3270 Adapter lets IBM PCs,
COMPAQ's and compatibles communicate with IBM
mainframes.

Just like the other 3270 emulation boards do.

But it runs all the competitive software.

Just like the other boards don't.

Plus it provides multiple host sessions, host printer
support and windows and graphics.

And it's backed by Businessland's trained 3270
specialists, who provide service, support and introductory
customer training nationwide.

So call (800) 323-1000 for locations nationwide. And
see what a good choice our 3270 Adapter is.

HP launches speedier models of 3000 to shore up low end

Boasts jazzed up memory, cache

By Jeffrey Beemer

CUPERTINO, Calif. — Hewlett-Packard Co. last week retired the three smallest members of its 3000 business systems family and replaced them with two 16-bit models that reportedly offer 30% to 50% better price/performance than the earlier machines.

Optimized for I/O-intensive applications in work groups, according to company spokesmen, the Micro 3000 and Micro 3000XE mark the first time HP has implemented 1M-bit memory chips and NMOS III logic in any of its commercial processors. NMOS III, a microprocessor technology proprietary to HP, first appeared in the vendor's 9000 series of technical and engineering workstations.

The Micro 3000 and 3000XE are also the first of HP's low-end departmental systems to support disk caching, an I/O-enhancing technique in which frequently used data resides in main memory to minimize access times. Disk caching was formerly restricted to the 3000 line's mid-range and high-end processors, according to Doug Spreng, general manager of HP's Computer Systems Division.

Because the Micro 3000 will be used chiefly by computing novices, the machine will be bundled with Easy Time, a previously unavailable shell that reportedly uses menus to simplify system operations such as printing and backup.

User shares enthusiasm

HP's enthusiasm for its low-end 3000 additions was shared by an early user and other outside observers. During the two months that Long's Drug Stores, Inc. has served as a beta-test site for the 3000XE, the company's experiences have corroborated HP's product performance claims. "We've gotten about 40% more throughput with the new machine than with the HP unit it replaced," said William Gates, the Walnut Creek, Calif.-based firm's DP manager.

For Long's, higher performance has translated into improved response times, "which are important because we put systems in our stores to provide customer service," Gates said. "The faster we can service our customers, the better off we are."

Alexia Martin, associate editor with the Seybold Office Computing Group, said the chief attraction of the Micro 3000 and 3000XE is that they combine big-systems capabilities with small-systems ease of use. Access to Easy Time makes "management of the systems simple for non-technical operators," Martin said. "But at the same time, the processors also provide advanced office services like file sharing and electronic mail and run the same HP Turbo Image data base software as larger 3000 systems."

The Micro 3000 and 3000XE lend credence to the view that HP's departmental processor family is alive and well, said Dataquest, Inc. President Gwen Peterson. "The rest of the industry tends to write the product line off. But HP doesn't, and neither do its customers."

Although the Micro 3000 and 3000XE use the same 9-MHz NMOS III microprocessors and are identical in their integrated packaging, the two machines differ substantially from each other. The Micro 3000, which replaces HP's existing Models 37 and 37XE, supports up to 16 users and is intended primarily for small businesses. By contrast, the Micro 3000XE replaces the existing Model 42, supports as many as 66 users and is geared to serve either as a departmental processor or as a host in the branch offices of major corporations.

Compared with the Model 37, the Micro 3000 provides 35% more system throughput for a 21% lower price, and the Micro XE equals the

performance of the Model 42 but costs 30% less.

Increased throughput is partly due to use of disk caching and the ability to support HP's latest line of disk systems, which performs 30% to 50% more I/O operations per second than earlier models, Spreng said.

Users of installed Model 37s or 37XEs can upgrade in the field to a Micro 3000XE by switching boards. Expansion from a Micro 3000 to a 3000XE, however, requires a wholesale swap of boxes. A similar exchange of boxes is also required to upgrade from the Micro 3000XE to the next largest system in the 3000 line, the Model 82. But because all HP departmental processors use the

same system software, users can migrate from a Micro 3000 or 3000XE to any other family member without converting their existing applications, according to Computer Systems Division marketing manager Bill Walker.

A basic 2M-byte Micro 3000 with an 81M-byte drive costs \$26,730 and expands to accommodate up to 4M bytes of main memory and 2.2G bytes of disk capacity. A minimum 3000XE also starts with 2M bytes but, with an entry-level price of \$37,600, incorporates a 130M-byte drive and holds up to 8M bytes of main memory and 4.5G bytes of disk.

Deliveries of both 3000 series additions begin next month.

TANDY... Better Again™

The New Tandy 3000 HD

A powerful workstation with networking and multiuser capacities.

The 3000 HD is compatible with the IBM PC/AT® and offers greater hard disk storage (40 megabytes vs. the PC/AT's 30), yet is priced at only \$4299 (vs. \$5295 for the PC/AT).

The Tandy 3000 HD uses the new XENIX® System V multi-user operating system. Using low-cost display terminals, a total of six users can share the power of the 3000 HD—working independently on such projects as accounting, word processing and electronic filing.

The high-performance design of the Tandy 3000 HD also makes it a natural for use in a local area network such as ViaNet® for efficient sharing of

resources. ViaNet can link together multiple MS-DOS® computers into a powerful office automation system.

Based on the 16-bit Intel 80286 microprocessor, the Tandy 3000 HD (25-4001) operates at 8 megahertz for high-speed performance. The Tandy 3000 HD features 640K main memory and a 5 1/4" slim-line floppy disk drive designed to read both 1.3-megabyte and 360K formats. This allows it to run either IBM PC/AT or IBM® PC software.

The Tandy 3000 HD is quality-designed and built by Tandy in the U.S.A. and backed by the best support in the industry. Come see it today!

Proteon unveils token-ring products for IBM, DEC units

Offers enhancements for T1, Decnet support

By Peggy West

SAN FRANCISCO — Proteon, Inc. last week unveiled products that link IBM Personal Computer ATs and Sun Microsystems, Inc. AT-compatible workstations into its Promet-10 and Promet-80 token-ring local-area networks (LAN).

The company also announced enhancements that allow its gateway product to support Digital Equipment Corp.'s Decnet and T1 1.5M bit/sec connections. Additionally, Proteon unveiled at the Locanet show here a

network interface system designed to do the job of an IBM 3274 cluster controller.

The Sun VMEbus Interface System provides for the first time a token-ring connection for Sun workstations, according to Patrick Lally, Proteon vice-president of sales and marketing. Interfaces to Proteon's 10M bit/sec Promet-10 and 80M bit/sec Promet-80 support the fastest data transfer speeds available for computer-aided engineering applications such as image transfer as well as network file access, he added.

The board-level interfaces include an optional optical-fiber link for applications that require greater resistance to electrical interference, Proteon said.

The Interface System supports Sun's Network File System, its version of Transmission Control Protocol/Internet Protocol (TCP/IP) networking protocols.

The basic Sun VMEbus interface for Promet-10 costs \$2,700. Boards with built-in fiber-optic connections are also available, priced at \$3,800 for single fiber, \$4,100 for dual-redundant fiber, and \$4,550 for counter-rotating fiber. All are available now. The Promet-80 board costs \$6,900; with on-board fiber connectors, its price is \$9,100 for single fiber, \$10,000 for dual fiber and \$10,400 for counter-rotating fiber.

Proteon's new P1303 board plugs into high-speed IBM PC AT-class ma-

chines, allowing access to the 10M bit/sec Promet-10 token-ring LAN, even for compatibles that run at 10 MHz, 12 MHz or 16MHz, according to Tony Bolton, Proteon marketing director.

The board also works with Compaq Computer Corp.'s new Intel Corp. 80386-based Compaq 386 Deskpro and PC's Ltd.'s 16-MHz PC AT clone. The P1303 board is priced at \$899 and is scheduled to be available in January.

User-configured protocols

Proteon also announced enhancements to the existing Proteon Gateway, which links Promet-10 and -80 token-ring LANs to other types of networks. The enhancements allow the gateway to be user-configured for different combinations of protocols. In addition to supporting network-layer industry standard protocols such as TCP/IP and XNS, the gateway now supports Decnet.

A T1 connection allows the Proteon Gateway to pass on transmissions complying to the above protocols across a wide-area 1.5M bit/sec link. Current customers can upgrade their Proteon system software for approximately \$995, said Michael Katz, Proteon product manager for gateway products.

The new gateways are being installed at the Institute of Defense Analysis in Alexandria, Va., where a software development team working on 18 Sun workstations and a network file server in two office buildings will communicate over T1 lines. An Ethernet link connects DEC VAXs running Unix, said Neal Schofield, computer services manager at the institute. While the system does not yet use Decnet, Proteon's gateway will make that an attractive option in the future, he added.

"What drove the decision was finding Proteon and Sun have worked together before, and the equipment seems to meet the needs," Schofield said.

"We have a lot of small work groups of four or five people, so the office lends itself well to small networks. The Proteon network gives us the flexibility to move workstations and people around as the work is done," he added.

Proteon's Katz said the T1 support is aimed at customers with geographically separated offices. "We've been getting lots of requests from our existing customer base, including Air-pant users, academic institutions and DEC users," Schofield said.

Government agencies find the data flow controls attractive, because they enable the system manager to provide selective access and secure sections of the network, he added.

The Promet 3270 Network Interface System is intended to replace an IBM 3274 cluster controller as an interface between a Promet-10 or Promet-80 LAN and an IBM host, Proteon said. The system connects directly to an IBM host bus and tag channel and supports up to 48 physical devices — 16 more devices than an IBM 3174 or 3274 cluster controller supports, Proteon claimed.

The Interface System is priced at \$33,200 and will be available in January. The Promet-10 connection is available now, and the Promet-80 link will be out in January, the firm said.

IBM Connectivity

I won't buy coax cards anymore!

Coax cards are expensive. They tie up controller coax ports, don't offer remote PC dial up and take up valuable PC card slots.

A more flexible and inexpensive solution is DataLynx™ 3274.

DataLynx connects IBM® compatible PCs to an IBM host... directly or over any async data path, including PABXs, LANs, data switches and public networks.

Multiple PCs can utilize DataLynx ports, substantially cutting host access costs. And the PC async port can be used for other services when it's not connected to the host.

For file transfer use TruLynx™ 3270 PC with DataLynx and personal computers appear to the host as real IBM 3270 PCs. TruLynx is compatible with IBM's resident host software giving you unlimited file transfer with error detection and correction.

When you want to connect a lot of PCs to an IBM mainframe host, don't buy coax cards.

Choose DataLynx 3274 for easy async-to-host dial up, file transfer, remote network management and diagnostics—everything a coax card promises you... and more.

DataLynx is the protocol converter Datapro rated best for micro-to-IBM mainframe connectivity.*

AT&T seeks to lower net rate

Also proposes increase in private line charges

By Elizabeth Horwitz

WASHINGTON, D.C. — AT&T last week submitted to the Federal Communications Commission rate changes that it claimed would reduce interstate long-distance prices by \$1.2 billion overall.

But a 9.3% increase in private-line charges that AT&T included in its proposal is likely to encounter active resistance from business customers, one user advocate group said.

With the proposed reductions, slated to take effect Jan. 1, AT&T is passing along cost savings that it will realize from lowered local access charges, which will mean an 8.1% overall reduction to the long-distance service for millions of business and residential customers, the firm said.

AT&T's suggested tariff changes, however, could mean substantial rate increases to business users that rely heavily on private-line connections, said Brian Moir, a partner at Fisher, Wayland, Cooper, Leader and counsel for the national user organization International Communications Association. While "AT&T has successfully painted a picture of overall rate cuts to the world, we feel that a 3.3% across-the-board increase to non-switched private-line services is ridiculous," he said.

Rate changes to AT&T's business (switched) service proposed last week include the following:

- An 11.6% reduction for state-to-state AT&T long-distance service calls during the day.

- A 16.7% reduction of monthly charges for Megacom and Megacom 800 services and usage charge reductions of 4% for Megacom and 1.4% for Megacom 800.

- An aggregate 4.2% reduction of usage charges for Software Defined Network services that involve private-line access.

- A reduction averaging 2.3% for AT&T WATS and 800 services, with some users experiencing a rate increase and introduction of a new monthly service charge for both services.

MCI Communications Corp. and U.S. Sprint Communications Corp. reportedly will lower their prices in response to AT&T's reductions. "It's always been our policy to be lower than AT&T," said U.S. Sprint spokesman Sydney Courson. "If that requires a rate adjustment by January 1, we'll do it."

AT&T also proposed across-the-board 3.3% increases for monthly recurring and nonrecurring charges for special services. Affected services include private analog and digital lines, the Accunet family of digital services, including Dataphone Digital Service, Alliance Dedicated Service and some SkyNet satellite services. The 3.3% increase also applies to minutes-of-use charges associated with Accunet Switched 56 Service and Accunet Reserved 1.6 Service.

AT&T's proposed increases do not apply to customers of Accunet Packet Service and SkyNet Star Network Service, which are subject to special accounting orders, or to Accunet T1.5 Service, for which pricing changes have already been approved by the FCC. That tariff, scheduled to take effect Dec. 8, reduces by 26% usage charges for distances of more than 100 miles and increases by 26% usage charges for circuits extending fewer than 100 miles. The change is part of AT&T's overall strategy to have pricing more closely reflect circuit cost and to stop having long-haul business subsidize short-haul business, Byrnes said.

AT&T is making the increases because "historically, we've earned far less than the authorized rate of return" on the above special services, said AT&T spokesman Jim Byrnes.

Moir took issue with Byrnes's explanation. "For three years now, I've heard AT&T make the claim that its dedicated services were not earning the authorized rate of return as a way to rationalize all kinds of rate increases," he said.

In a separate FCC filing, AT&T proposed a new 2.4K bit/sec. access option to its Accunet Packet Service. The proposal is scheduled to start Dec. 29 and is AT&T's attempt to boost demand for the packet service, "which needs all the help it can get," Byrnes said.

Users and vendors blast FCC protocol conversion proposal

By Mitch Betts

WASHINGTON, D.C. — Value-added network vendors and communications users last week lambasted a federal proposal to regulate protocol conversion services, arguing that it may force vendors out of business.

The controversy surrounds the Federal Communications Commission's proposal to allow AT&T and the divested Bell operating companies to offer protocol conversion — now an unregulated, enhanced service — as a regulated, basic service. An FCC decision on the matter is expected in January.

AT&T and the Bell operating companies argued in their filings to the FCC that protocol processing is a natural adjunct to basic service and that it would be more efficient to embed protocol conversion in regulated services such as packet switching.

But competitors said the proposal could hand the dominant carriers a monopoly over protocol conversion. "It could easily put us out of business," said Paolo Guidi, president of Teletel Communications Corp., a network vendor in Reston, Va.

The proposal also would subject firms such as Teletel to common-carrier regulation at the federal and state levels, contrary to the FCC's recent push for deregulation, Guidi stated at a press briefing.

If the FCC reclassifies protocol conversion as a basic service, then the dominant carriers could easily combine protocol conversion with regular network service without having to implement the competitive safeguards required for enhanced services under the Third Computer Inquiry regulations, according to filings submitted to the FCC.

Spokesmen for the International Communications Association and the Ad Hoc Telecommunications Users Group said this scenario would reduce competition and deprive users of a diversity of suppliers.

G. Clark Woodford, vice-president for telecommunications services at Compuserve, Inc. in Columbus, Ohio, said the regulatory burdens and carrier-access charges for dial-up lines — about 12 times higher than the line charges it now pays — would probably force Compuserve out of the value-added network business. Compuserve has 216 large clients, including contracts with Visa and American Express Co. for credit card authorization transactions, he said.

"Regulation is deadly to these companies," said Warner Sinsback, manager of telecommunications affairs for General Electric Information Services Co. in Rockville, Md., and a spokesman for ADAPSO, a computer services industry association.

CPF

The CICS Print Facility

CPF is the complete CICS based report distribution system.

Features include:

- Spools reports from CICS applications
- Message sending
- Allows secured user access to reports
- Automatic Aging
- PF key driven, with help screens
- Spools reports from JES or POWER
- Forms controls
- Displays reports on-line
- Screen copy for any CICS screen
- And More!

CPF allows sites to choose how they want reports distributed. Print batch reports on-line or print on-line reports in batch. Complete control of report distribution is accomplished at every level in your organization. Site specific install options allow sites to utilize the package for their own specific use. CPF is a full feature print spooling package that performs the work of up to ten other products.

CPF is available for OS and DOS sites and is compatible with all CICS environments. Call today for a free trial or more information — (202) 842-1971

Telex targets System/36, 38-compatible peripherals mart

Hopes to cash in on 370 overlap in IBM shops

By Alan Aizer

NEW YORK — Diversifying its mainstay IBM 3270-compatible peripherals line, Telex Computer Products, Inc. last week unveiled a family of terminals and printers that operate within IBM System/36 and 38 environments.

The Tulsa, Okla.-based firm said its decision to enter the compatible peripherals market centers around the coexistence within many IBM shops of System/36 and 38 computers and those that use the 370 architecture.

"We expect that there is about a 40% market overlap between the two," noted R. Frank Jerd, Telex vice-president of sales. "We are the No. 1 supplier of IBM 3270-compatible peripherals and thought we'd broaden our efforts... since we're calling on the same people."

In entering the System/36 and 38-compatible market, Telex will be faced with the unenviable task of competing in a business totally dominated by IBM. Unlike the 3270-compatible arena, in which Telex has about 15% of the business, a thriving IBM systems-compatible business has never developed, analysts said, due to the relatively small size of the market.

Approximately 310,000 System/36 and 38-compatible terminals were shipped domestically in 1985, according to market research firm International Data Corp. (IDC) in Framingham, Mass. IBM controlled 58% of the market, with Decision Data Corp. and Memorex Corp. accounting for 9% and 3% of the business, respectively.

IDC said it anticipates domestic shipments will grow by between 8% and 10% this year, representing about 340,000 to 360,000 terminals. The firm projects a flat shipment rate for 1987.

Telex said it expected to grab about 15% of the System/36 and 38 peripherals market within the next three years.

Departmental processing grows

"The remote or departmental processing concept continues to grow among the Fortune 1,000 companies," noted Roy L. King, Telex executive vice-president of field operations. "There are over 100,000 System/36 minicomputers installed now, worldwide. And the installation base for the System/36 is also growing. That's why Telex has decided to enter this market."

Telex should be successful in obtaining a market share based on its reputation in the 3270-compatible market, noted Ilene Goldman, an analyst with IDC. The mitigating factor, she said, is the impact of IBM's recently announced 8870 departmental computer family, which extends the 370 architecture into the high-end of the System/36 and 38's mid-range.

"They have a significant name in the business," Goldman said, although she expressed concern over the future of the System/36 and 38 business.

Telex introduced four terminals, including the first low-cost 12-in. dis-

plays to be marketed to users of the three IBM systems, and four printers, including a low-end laser printer. The firm also announced an IBM 5251 emulation support feature for its Telex 1200 series of intelligent workstations, which enables users to switch between local processing and System/36 and 38 sessions by pressing a hot key. All the products will be available from the company 90 days after receipt of order. Telex is also evaluating alternate channels of distribution, Jerd noted.

Telex Model 078-2 is 12-in. terminal displaying 1,920 characters on a tilt and swivel monitor. Priced at \$1,295, the terminal's display comes in either green or amber.

The Model 079-2 is a 12-in., seven-color terminal that also displays 1,920 characters on a tilt and swivel monitor. Claimed to be the only low-cost IBM 3179-2-compatible terminal on the market, the unit lists for \$1,895.

The 180-2 is monochrome 15-in. terminal that displays either 1,920 or 3,564 characters and is plug-compatible with the IBM 3190-2. It is priced at \$1,995.

A 14-in., seven-color terminal, Telex's Model 179-2, displays up to 1,920 characters. Plug-compatible with the 3179-2, it lists for \$2,095.

All of the Telex terminals have a 122-key adjustable keyboard with up to 1,500 keystrokes of record/play-

back, the firm said.

The new printers include the Model 201, a dot matrix printer priced at \$545, which operates at up to 220 char./sec. and features a single sheet autoloader; the 961, an ink-jet printer that lists for \$775 and runs at speeds up to 220 char./sec.; the 214XP, a high-end multifunctional dot matrix printer priced at \$5,100, which operates at speeds up to 400 char./sec.; and the 225, a line matrix printer operating at up to 800 lines per minute.

Single unit price for the 5251 emulation feature is \$849, the company noted. Volume discounts of up to 24% are offered on the whole product family, Telex said.

ONLY ONE COMPUTER CAN PASS THIS TEST.

Only the ITT XTRA/286 ATW™ comes with built-in Enhanced Color Graphics as a standard feature. Not to mention the ability to print and work at the same time. Or run more than one program simultaneously. Plus operate 30% faster than the

WASHINGTON UPDATE
Mitch BattsGSA spells out details to
FTS 2000 net procurement

The U.S. General Services Administration (GSA) recently spelled out more details of its proposed Federal Telecommunications System (FTS) 2000 intercity digital network, including a price structure intended to keep pressure on the winning vendor.

Critics have said there will be little incentive for the winning vendor to keep its prices low once it wins the \$4.5 billion, 10-year contract for FTS 2000. But in GSA's second draft re-

quest for proposal (RFP), the agency said the prime contractor must adhere to fixed prices for each of the 10 years of the contract, with only two exceptions: The contractor may lower prices at any time, and price adjustments will be made in the fourth and seventh years if market conditions warrant.

Furthermore, GSA said a monetary award will be granted for every percentage point the FTS 2000 price decreases after the fourth year.

A final RFP is expected Dec. 31, so the contract can be awarded in 1987. Bidders are expected to include AT&T, Martin Marietta Corp. (teamed with MCI Communications Corp.), Boeing Computer Services Co. and U.S. Sprint Communications Co.

Researchers at International Data Corp.'s Washington Division, based in McLean, Va., recently reported

that GSA is likely to favor a software-defined network architecture, available from AT&T and MCI.

CBEMA disputes study
forecasting trade deficit

The Computer and Business Equipment Manufacturers Association (CBEMA) said a new congressional report that predicts a high-technology trade deficit for 1986 incorrectly suggests the U.S. computer industry is in trouble.

CBEMA President Vico E. Henriques predicted the U.S. will end the year with a \$5.3 billion surplus in its computer trade balance. "We do not normally release predictions about our trade balance," Henriques said. "However, we feel it is necessary to

correct an impression left by the new Joint Economic Committee study that our industry is in trouble."

Henriques said the congressional report lumps together computers, aircraft, instruments, specialty chemicals and several other commodity items and concludes the aggregate will have a trade deficit. He said CBEMA is concerned the conclusion will encourage Congress to support protectionist legislation.

Henriques acknowledged that the U.S. computer trade surplus has dropped during the past few years but said trade balances are not particularly accurate indicators of the industry's health, since many computer firms are multinational.

OMB revises statistics
to reflect industry shift

The U.S. Office of Management and Budget recently announced final revisions to the government's method of reporting industry statistics in order to reflect changes in the computer industry.

The revisions, effective Jan. 1, affect the ubiquitous Standard Industrial Classification (SIC) system, the four-digit SIC codes used in government statistical reports to identify distinct industry categories. The codes have not been updated since 1977, and consequently they lump many computer industry segments under broad categories, masking industry trends (CW, March 9).

The revisions are expected to improve industry research and provide higher visibility for industry segments such as electronic information retrieval services, a category that was grouped with computer facilities management services under the broad category of data processing services.

The revised SIC system creates separate codes for each of the following computer industry segments: custom programming services, prepackaged software, electronic information retrieval services, computer rental and leasing, computer maintenance and repair, and computer and software retail stores. Also, the broad category of computer manufacturing will be broken down into separate codes for computers, storage devices and other peripherals.

Federal systems market
could reach \$4B by '91

The federal systems integration market will continue to show strong growth, topping \$4 billion in 1991, according to input, a research firm with a Rockville, Md., office that studies the federal market.

"Wary of cost overruns and late delivery, federal agencies are sharing implementation risks with vendors," the firm reported. The forecast said the market will grow, at an average annual rate of 16%, from \$2 billion in 1986 to \$4.1 billion in 1991.

Future government contracts are expected to include scientific and engineering turnkey systems, records management, medical systems, publishing and computer-assisted education systems, input said. Some of the projects include the Federal Aviation Administration's new air traffic control system and the Internal Revenue Service's tax system redesign.

VIEWPOINT

EDITORIAL

For our eyes only

It sounds all too much like the plot of a James Bond movie: Soviet bloc operatives covertly purchasing IBM 3090s and disassembling them to discover their computing secrets. Russian students-cum-spies in every European capital combing through commercial electronic data bases for tidbits of scientific, technical and economic data that would give the Soviets an edge in, say, developing fiber-optic technology or even in negotiating a wheat contract.

Such are the scenarios painted by the Reagan administration in its continuing campaign to deny our "enemies" access to technology, both products and research and development data, as well as to assorted other categories of information — agricultural, economic, scientific — that might in any way endanger our national health or security.

The campaign began two years ago, when President Reagan issued National Security Directive 146. Its aim is to ensure the security of computer systems that process classified and so-called sensitive-but-not-classified information, as well as to provide security assistance to the private sector. Charged with realizing these goals is a 22-member National Telecommunications and Information Systems Security Committee, which is headed by an assistant secretary of defense and the director of the National Security Agency.

This week and last saw the latest, and most chilling, steps in the Reagan effort. At last week's annual conference of the Information Industry Association, the trade group representing vendors of information services, a Department of Defense official declared, for the first time, that the federal government was sure to place controls on commercial on-line data bases in order to protect national security. It was, she said, only a question of when and how. Particularly troublesome to the Defense Department is that in the process of gathering and processing unclassified data, data base suppliers create combinations of information that may be sensitive.

Now comes this week's news reports regarding a memo from the president's national security adviser that instructs all federal agencies to identify and protect with stringent computer security measures sensitive information held in government computers.

The spy-movie language and generally unsupported data used by the Defense Department in its description of this "massive, well-organized campaign to acquire Western technology," which yields Moscow "many tens of thousands of documents," may make it tempting to dismiss administration concerns as unnecessary and alarmist.

What is needed instead from all those in the technology community is a recognition of the seriousness of the problem — the need to work out an appropriate balance between the right to free access of information and the legitimate requirements of national security — and an active lobbying through professional and industry groups for an appropriate forum in which to debate that balance. The issue is too critical, too comprehensive and too basic to the both the nation and to the practice of technology to leave it in the hands of those within the defense establishment.

LETTERS TO THE EDITOR

Privacy and information handling

The federal government requires banks to file reports on an individual's transactions that exceed \$10,000 per day. Recent actions to reduce this limit to \$3,000 per day constitute one of many indicators of a fundamental trend. Allowing data originally given to one government agency for one purpose to be used for another purpose (euphemistically called "computer matching") is another example.

Clearly the government is expanding the types of data it keeps about people as well as the uses of such data. Preventing drug abuse, locating parents not paying child support, apprehending criminals and other laudable objectives are offered as reasons such new types of data should be gathered and why previously gathered data should be used differently. Although there is much talk about why these things should be done ("A call for consensus," CW, Oct. 27), there is little discussion of the long-term repercussions. Compared with Europeans, Americans seem unconcerned about the privacy and liberty issues that such actions should naturally cause us to consider.

Meanwhile, we in data processing have largely been facilitating this process. Like good soldiers, we have all too often been blindly following orders. We have been using the latest and greatest technology to make these actions not only feasible but low cost. Nonetheless, we in data processing have a unique vantage point about information handling that should be, but is often not, communicated to government policy makers. We should be willing to take more stands about information handling practices we consider right, decent and appropriate. It is hoped we will see more American actions like those taken by employees of an Italian company who recently went on strike because they recognized the system monitoring threats imposed by a password-based computer access control system.

Commodore's revolutionary PC

In "Siring up computers: From supermicros to super supers" [CW, Oct. 27], Harvey Newquist writes, "... the introduction of the 386 chip will give personal computers — sorry, micros — the ability to operate with the speed and efficiency

equivalent to some engineering workstations."

I was surprised Newquist did not realize that such a computer — Commodore Business Machines, Inc.'s Amiga — already exists. For those not familiar with the Amiga, I would point out some of its features: A Motorola, Inc. 68000 CPU, a multitasking operating system with built-in windowing, graphics, animation and sound and speech synthesis.

It can be upgraded to use 8.5M bytes of main memory, and upgrades exist that use a Motorola 68020 CPU with floating-point coprocessor to replace the 68000.

Software? Languages such as C, LISP, Modula-2, Fortran and Fortran with fully capable compilers, including interfaces to the several hundred operating system routines, all for under \$160. Paint programs to create high-resolution graphics with up to 32 colors selected from a palette of 4096, and animation programs to create sophisticated computer animations with three-dimensional effects for under \$200.

Word processing with the ability to window and work with several documents at one time. Again, all under \$200. Spreadsheets with real-time, three-dimensional graphics attached to cells so cell updates automatically and immediately update the graph.

The cost of this computer? About \$2,000 with a megabyte of memory, internal and external 34-in. disk drive, red-green-blue video monitor, operating system and several software packages.

There is no question that this machine is revolutionary. Since CW Communications publishes Amiga World magazine, maybe you should take Harvey over to see the Amiga, so he can have something more advanced to write about than a desktop IBM 4860.

VIEWPOINT

The fantastic voyage: Charting a human-computer interface

Skip Walter clapped his hands together loudly, startling several people in the front of the meeting room.

Walter, Digital Equipment Corp.'s manager of business office services and applications and the "father" of All-In-1, was making a point.

He was telling the attendees at a recent industry executive forum about some of his explorations into the nature of communications, explorations that could eventually lead to the design of new and radically different office information systems.

Sophisticated methods

Right now, he said, the computer-human interface is primarily visual and character-based and works fairly well. But every day, in the simplest person-to-person interchanges, human beings use far more sophisticated methods of assimilating, storing and communicating information.

To illustrate, Walter recalled a financial officer at DEC who used an interesting analogy to explain why substantial cash reserves were necessary for a fast-growing company.

It is like driving down a highway, the man said, in a car marked income. Right behind you is another car with the words painted in big red letters on the side.

Now you know, for safety's sake,

*Kirkling, a former editor of Data-
management magazine, is an industry
commentator and author of editorial
advice to Patricia Seybold's Office
Systems Group.*

there should be a car's length of distance between your car and the car behind you—the safety zone. That is your cash reserve.

Now if you're driving at a sedate 10 mph, you don't need much space between vehicles. But here you are, clipping along the thruway at 60 mph in your souped-up, fuel-injected income sports car. If you're without adequate cash reserves, you're racing down the highway with that Expenses car a mere four inches from your rear bumper. If your income falters for even an instant, what happens? Wham! And here Walter clapped his hands together, making his listeners jump.

What, the story, he explained, took a dry accounting idea and made it understandable and memorable by appealing to all the senses we use to assimilate information—the visual (you can see the car), the auditory (the hand clap) and the kinesthetic (you can feel yourself speeding down the road and sense in your gut the wrenching impact of two crashing vehicles).

What people want, Walter explained, is communication, not information. "I receive 100 mail messages a day," he said. "That's 600 to 700 pages of information. I can't physically scan, much less read to understand, all the trade publications and books I need to talk with all the people I need to. I don't need more information; what I need is a way to

capture and share knowledge. A way to communicate with others and with myself about the meaning of facts— not moving these facts back and forth."

Walter was delving into difficult questions. He was probing that often-explored but little-understood area where people, processes and technology combine to form what he characterizes as a living, intelligent structure.

William Wordsworth, when writing about the modern scientific method, which attempts to understand a process by chopping it up into separate pieces, said, "We murder to dissect." The point is that the intelligence of the structure cannot be isolated: it is enmeshed in the total structure itself.

To communicate knowledge across this living network of people, processes and technology, new and innovative methods of presenting information must be developed. They must involve our visual, auditory and kinesthetic senses.

To illustrate his point, Walter unveiled some proprietary research on which his group is working. He showed several short videotapes about a mundane subject—data base design.

But the tapes were far from mundane. The attendees saw the data elements in three dimensions and in color. Elastic connectors, fine white filaments, stretched between the

data elements, visually indicating the web of relationships. It was reminiscent of the film *Fantastic Voyage*, in which the characters, miniaturized by technology, enter a man's body and use a tiny submarine to sail through the uncharted regions of his body.

Shifting relationships

In the DEC video, you move in three dimensions among the data, changing it, rearranging it, retrieving it, observing in real time how the relationships between elements shift.

More important, because of the way the data is presented, you are able to bring your intuitive faculties to bear as you roam this digitized landscape.

The videotapes were rudimentary, but the possibilities are fascinating. Imagine adding sound and a joy stick. You could zoom among the towering structures that you have built like a intergalactic fighter pilot from Star Wars. Others could join you in this network of information and ideas, and, like explorers mapping uncharted territory, you together discover new relationships, new roads to explore. Unlike real life, if you fall off a cliff, it's not fatal; you simply push the reset button and try again.

Walter sees it, the next step is deceptively simple but hard to realize: the design of human interfaces that use sound, pictures and movement. As this approach develops, we will be making the first tentative steps toward tapping the tremendous capabilities latent in the partnership between man and technology.

Seek elegance of architecture in reduced instruction set design

Open any computer newspaper or magazine and you'll run into the term reduced instruction set computing (RISC). Everyone's getting into the RISC act: new firms such as Ridge Computers Co. and Pyramid Technology Corp. and old ones such as Hewlett-Packard Co. and IBM. RISC is a headline-writer's godsend: You read about "RISC-y Business" or "Taking a RISC." But is RISC an MIS manager's godsend or nightmare?

RISC represents an approach to designing a computer's instruction set. Every computer has one. It defines the individual steps by which computers break down statements such as ADD TAX TO BILL GIVING TOTAL. Cobol programmers don't see these steps. The designer's challenge is to pick a set of step types that suit Cobol (or whatever) and can be built cost-effectively with the available technology. Computer designers have debated the ideal instruction set for decades.

Through the early 1980s, the trend was to make the instruction set

as comprehensive as possible. "Let's define a single instruction to do the Cobol PERFORM... VARYING," said one designer to another. "Amem," said the second. "And while we're at it, how about PL/I DO WHILE?" So it went. Digital Equipment Corp. used to advertise that its PDP-11 systems had over 400 different instructions. The VAX has more.

There are caveats: who buck every trend. Complex instruction sets were no exception. The Control Data Corp. 6600 of the mid-1960s had few instructions, but they were carefully chosen and ran faster than anything else at the time.

Instruction types

The Data General Corp. Nova of the late 1960s, at the other end of the price spectrum, was similarly stripped down. It had few different instruction types, so it executed more instructions per job than its more richly endowed contemporaries. But with so few instruction types, its designers could make each the most powerful and fast. The net effect was, approximately, a tie.

Now major vendors are following the same philosophy. Hewlett-Packard Co. has bet its corporate future

on the RISC-like Spectrum project. The IBM RT Personal Computer was the first commercial appearance of a RISC project that had been under way internally for years.

The arguments for the approach sound good. The RISC principle—Keep It Simple, Stupid—is always valid. Complex instructions are rarely used, since people don't really know how to write compilers that use them effectively. Meanwhile, they weigh down a computer with hardware that is needed if and when a program does use them. This hardware is a potential area for design errors and failures and, could, in any case, be better used to make the really useful instructions go faster. Or so RISC proponents say.

Having heard more than one sales pitch for a RISC system, I must agree that the arguments sound logical. RISC may be a better approach to instruction set design. Less is more, and all that. But should DP managers selecting new systems care? In 90% of the cases, they shouldn't. A computer is built with some amount of hardware and runs at some level of performance. The amount of hardware determines (to a

first approximation) the reliability of the electronics and has a relationship to processor cost. The level of performance is what it is, no matter how it is achieved.

Elegance of internal architecture is a matter for legitimate engineering pride. But it is seldom a concern of users. True architectural elegance will show up in the performance obtained with a given amount of hardware. User managers should care about that.

Elegant design

If a computer has the best price/performance for a job (other factors such as software and support being equal), it shouldn't matter if it was designed with RISC or peanut butter. If it doesn't, elegant design will not make up for these deficiencies.

As an engineer by training and a computer architect by experience, it pains me to reach this conclusion. But I can honestly reach no other. If someone comes to your office proud of his new RISC system, listen. But listen not to why RISC architecture is wonderful but to what it offers you.

If it really is wonderful, it will offer tangible benefits in price/performance or other areas. Look for the benefits, not the buzzwords. Seeing the truth through the terminology is part of what you're paid for.

In search of the racer's edge

There are few areas of U.S. business that do not take the issue of competitive advantage seriously. But it has been only in the past few years that computers and information have begun to be seen as a key part of competitive advantage.

Thinking (and still unclear on the opportunities (and limits) of computing's role in establishing an enterprise's competitive advantage. Textbook examples range from airline reservation systems to order/inventory systems, such as that pioneered by American Hospital Supply.

But that is history. What have computers done for companies lately? Consider for a moment the increasing standardization at all levels of computing since the early 1970s:

- For new applications, IBM's mainframe architecture is nearly always selected. The IBM Personal Computer family is also a de facto standard.
- Communications and communications protocols are also increasingly standardized; witness the surge of hardware manufacturers offering their own, presumably compatible, version of IBM's Systems Network Architecture (SNA).

• In the software area, a common systems software environment is emerging. The resources and the risk involved makes the chances quite small, for example, of an analogy to

O'Flaherty is a principal of Information Service Strategies, N.Y.-based consultants on improving the effectiveness of information systems.

Specialist: Reusable code helps increase productivity

By Ninamary Duba Maginnis

CAMBRIDGE, Mass. — Firms that do not organize libraries of zero-defect, reusable software could be jeopardizing their businesses, according to T. Capers Jones, chairman of Software Productivity Research, Inc. and author on productivity measurement.

"Reusable code is taken seriously in Japan and should be here too," Jones said, speaking at the Strategic Issues in Managing Information Technology conference here last week.

"To me, this is the most important branching point. In the long run, it will determine which companies will stay in business and which ones won't."

It takes about 36 months to develop a large application today, Jones said. By 1990, if a company has a good reusable code library, development time can be cut

to six months. Without such a library, development time will still take 24 months, he said.

The results of a California study proved that software systems are highly redundant, with 75% of application code, 50% of systems programs and 70% of telecommunications programs sharing identical code or functions, according to Jones.

Jones, who spoke at a conference sponsored by Cambridge-based Decision Support Technology, Inc., offered some suggestions to aid companies in organizing reusable-code libraries.

• Teach programmers commonly used routines.

• Build unique extensions on generic base programs.

• Include common routines as statements in high-level languages.

DG, GE to offer factory software

System manages shop floor activities, communications

By Rosemary Hamilton

DETROIT — Data General Corp. has teamed up with General Electric Co. to market factory management software developed and currently used by GE.

The DG/Factory Management System (DG/FMS), announced at the Autofac '86 trade show and conference held here earlier this month, will be available in the near future, according to a DG spokesman. It runs on the DG line of Eclipse MV superminicomputers and was designed to manage shop floor activities as well as factory communications.

"DG's intent is to sell more MV systems in the factory environment, which has traditionally been Digital Equipment Corp.'s domain," said Anthony Frisica, president of Advanced Manufacturing Systems, a

consulting firm in Chicago. "What will sell this system isn't the hardware; it's the capability of the software. This gives DG an edge that they haven't had before."

DG also said the software would include support of the Manufacturing Automation Protocol, the emerging factory communications standard, by mid-1987.

In addition to marketing support, GE will provide consultation for the installation and customization of the system through its Consulting Services Corp., according to DG.

DG will provide hardware and software interfaces for the factory floor devices and the DG equipment that will manage those devices.

The software, which has been in use at one of GE's steam turbine generator plants since 1984, can be tailored for a variety of manufacturing procedures, DG said. A base price for a total package, which would include DG/FMS, hardware and consulting, is \$1 million.

Genesys development system allows customer modifications

Modules add function to old, new applications

By Charles Babcock

LAWRENCE, Mass. — A producer of mainframe human resource packages is offering a dictionary-based development system that works in conjunction with the firm's applications.

Genesys Software Systems, Inc. of Lawrence has introduced the AL 2000 development system, which includes Historian, Reporter and Manager modules working in conjunction with the dictionary to add functions to Genesys applications or develop auxiliary applications.

Genesys offers standard human resources applications, including payroll and medical claims, and will

include the development system in conjunction with the purchase of any of them, according to Michael W. Miller, vice-president of marketing.

Run under PC-DOS, MVS

He added that the applications are priced at \$37,000 for payroll, for example, running under the IBM PC-DOS operating system, and up to \$113,000 for the same application running under IBM's MVS and IMS.

With such a system, end users in personnel at a bank in Pennsylvania were able to modify their insurance claims system to meet the requirements of the federal government's Consolidated Omnibus Budget Reconciliation Act, Miller said.

The 1986 law, Miller companies to give former employees the option of extending their health insurance coverage for 18 months.

Miller pointed out that a bill sponsored by Sen. Edward Kennedy (D-Mass.) requires employers to pay for the first four months of coverage. If such a modification is adopted, it would be possible to modify the Genesys systems without extensive programming, Miller claimed.

Generate additional screens

The data dictionary of the system includes a screen generator that can be used to generate additional screens in an application.

The Historian module archives human resource data automatically, allowing a programmer to modify historical data used with standard applications or to create new application histories.

The Manager module runs the applications and routinely does repetitive tasks such as calculating pay

and deductions or enrolling a one-year employee in the company's profit-sharing plan.

Electronic generation

The Reporter module can generate electronic, magnetic or printed reports from information in the system.

Genesys is a 6-year-old, privately held company that emerged from Wang Laboratories, Inc. The firm was formed after Wang purchased the human resource systems of Phil Hankins, Inc.

Eighteen former workers in the Wang human resource applications section bought the rights to the software and formed a company that was formed May 124, Miller said. Genesys reported revenue of \$9.9 million at the end of its fiscal year ended June 30.

SOFTWARE & SERVICES

MIT director: AI must expand problem models

By Charles Babcock

CAMBRIDGE, Mass. — Expert systems builders need to expand the ways they represent problems until they can attack them from "multiple levels of abstraction," said Patrick H. Winston, director of the artificial intelligence laboratory at MIT.

Two of the most common methods of problem solving, frequently encapsulated in commercial expert system shells, involve forward or backward chaining. They use a series of IF-THEN rules to match conditions to conclusions that push a reasoning process along a predetermined path.

In an address to the Strategic Issues in Managing Information Technology conference last week, Win-

ston cited an example of how an adder malfunction could be corrected by using a model without resorting to forward or backward chaining. An adder is the logical device in a microprocessor that executes arithmetical addition. When the adder yields erroneous results, a comparison of a model of the adder with a series of results can pinpoint the error.

"Rule-based systems are real idiot savants. They don't use models. They don't use experience — not much, anyway. They don't exhibit common sense," he noted. Mycin, an expert system for diagnosing medical cases, once prescribed a barrel of penicillin for a patient because of a data entry error, Winston recounted.

Rule-based systems attempt to reduce a process in the real world to a set of rules. A model is another way of representation. In the future, "good systems may require more than one representation," he said.

Winston criticized the tendency to write expert system shells in C or Cobol instead of the symbolic processing languages, LISP and Prolog. By working in Common LISP, which he called an industry standard for LISP, developers can get the portability of C but keep the symbolic processing language's strengths. The inefficiency of symbolic processing languages is a "disappearing myth" that originated with inefficient compilers, he said.

Reusable code said to aid productivity

From page 19

them in a module or macro library and embed them in menu-driven systems such as program generators.

• Share the same programs across units.

Aside from reusable-code libraries, there are other ways firms can improve productivity. For example, Jones said, if a software salesman tells you that buying a certain tool will give your company instantaneous productivity, do not believe him.

"It may not be the right tool for you," Jones warned. Often a site visit can help potential buyers examine pragmatically what tools are being used, Jones said.

Productivity is sociological as well as technological. "When Hartford Insurance wanted to introduce new technology, they made a major campaign out of it," Jones noted. "People will fight it tooth and nail unless you encourage acceptance," he said.

Training is necessary for any productivity gains, Jones noted. Approaches in developing software change so often that key people need to be updated constantly. "Those who provide 10 to 20 days' training per year have more productivity than those without any training."

Productivity gains can be divided into four groups, or plateaus, according to Jones. For a 5% to 25% improvement, a company using a single technology should use structured code, high-level languages, reviews and inspections and interactive tools and terminals.

To jump to the second plateau and a 25% to 50% improvement, a firm must combine several technologies, including design control, design reviews, code inspections, structured code, high-level languages and direct coding aids.

Reaching the third plateau and a 50% to 75% productivity improvement means hiring superstar personnel, using program generators and standard functional modules. To arrive at the fourth plateau and improvements greater than 75%, developers must make extensive use of program generators and standard function modules, Jones said.

DG, GE to offer factory software

From page 18

sulting services, is \$200,000, while a typical system would cost between \$600,000 and \$1 million, DG said.

DG/FMS is made up of three integrated modules: Factory Communications, Shop Floor Control and Distributed Numerical Control. The Factory Communications portion manages a factory network connecting shop floor terminals. Shop Floor Control automatically schedules jobs and tracks those jobs as well as the status of shop floor equipment. The Distributed Numerical Control module handles the electronic transmission of numerical control instructions from a minicomputer to the machine tool that will actually perform the job.

In search of the racer's edge

From page 19

the AirLine Control Program emerging now to fill a similar specialized need.

• Similarly, the expense, time and risk of developing homegrown applications has produced a large and growing packaged applications industry in the last decade.

But if most companies are using similar hardware, software and communications environments, how will any one of them gain a competitive edge?

This is an issue that only a few companies are grappling with, partly because only a handful of organizations are currently addressing in a coherent fashion the question of how to use computers to gain and keep a competitive edge.

Most other enterprises are still, implicitly, treating computer systems as support tools, the same way

The software issues are far more interesting — and important. Software packages can play an important role in forming an information system for competitive advantage:

• Some "packages," like the leading fourth-generation languages, are building blocks that can be used to build totally unique applications.

• More typical applications packages, such as those used in the insurance or banking industries, offer so many options, tables, exits and so on that there is almost an infinite number of quite different systems that can be constructed.

However, any one company may only need a small percentage of the options. More important, these packages usually have a certain "point of view" that may not fit into an enterprise's way of doing business.

• To get around this, what some

customers do is to buy a package's source code and use its framework and build their own unique system on top of the package's foundation.

• Ultimately, of course, some enterprises find themselves going full circle and writing applications themselves from scratch.

There are numerous permutations of these alternatives. But all the methods point in a common direction — distinguishing a common physical computing environment through the use of software.

Gaining the edge

Depending on software for important competitive systems may heighten certain risks. Successful companies get their advantage over less successful companies in several ways:

• Targeted markets/customers.

• Ongoing new products/processes.

• New marketing approaches.

• Rapid entry, exit, response.

• Attention to quality and getting it right the first time.

All these things demand a quickly built system, many, even abrupt, changes in direction and not making many mistakes. This, unfortunately, does not remind me of most custom-built software that I know. There is a tendency, in fact, for systems to be developed slowly and be quite fragile when completed.

Are there answers? There are certainly parts of answers, but there are no magic bullets nor approaches that do not have risks of their own.

A later column will explore some of the ways that successful software can adapt to the need for competitive systems.

77

If most companies are using similar hardware, software and communications environments, how will any one of them gain a competitive edge?

they treat surrounding business functions like personnel, inventory, order entry, accounting, manufacturing and so on.

Competitive advantage systems are, by their nature, not support systems. There are several problems in having an off-the-shelf system performing competitive advantage functions:

• Management feels uneasy if its computer system, dedicated to proprietary uses, is about the same as everyone else's.

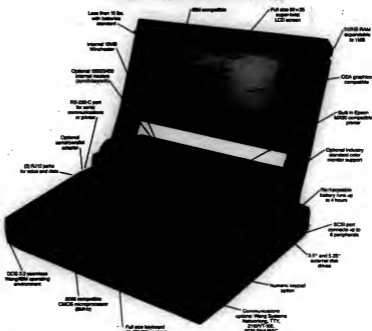

• Management may feel even more uneasy if the underlying software is supplied (and maintained) by a third party.

• Even if it makes sense to have industry-standard computer systems, what happens if the enterprise's business operations are not, in fact, industry standard? The problems of converting manual processes can range from daunting to impossible.

• What if, in fact, these underlying nonstandard processes make the enterprise unique and give it a competitive edge in the first place? Most organizations could not and should not consider nonstandard hardware or communications solutions to business problems. While it might be feasible at a particular point in time, the organization that develops a nonstandard environment would have diverged from the mainstream of vendor-sponsored future development.

To develop a follow-on generation of nonstandard hardware is expensive, and technical progress may be impossible. This is essentially the problem that has faced the BUNCH companies in the 1980s.

No other portable has ever been carried this far.

Introducing the Wang Laptop Computer.

When we built the new Wang Laptop Computer, we equipped it with the most comprehensive set of features ever offered in a portable,

including a built-in printer, 10 MB Winchester, SCSI port, and seamless Wang/IBM PC compatibility.

In fact, we made the Laptop so powerful, you won't think of it as a portable. You'll think of it as the only desktop computer that weighs less than fifteen pounds and runs on batteries.

With so much going for it, we have reason to think the Wang Laptop Computer will be carried away more than any other portable.

Whatever your company's processing needs, Wang makes it work. 1-800-225-WANG.

HARD TALK

James Connolly

Optical storage comes of age

A walk through the exhibits at Comdex/Fall '86 provided proof that a technology that was little more than experimental a few years ago has taken major strides toward general acceptance and practicality.

The technology is optical storage, and it is steadily overcoming some of the barriers it faces en route to use in everyday DP applications. It seemed every storage equipment and media vendor had an optical storage display at Comdex and that those were the displays that caught attendees' attention. But more significantly, unlike some earlier computer shows, Comdex offered a chance to see optical drives and media designed for all types of systems, from microcomputers to mainframes.

While one must keep in mind that some of what was being displayed may turn out to be vaporware from start-up companies that will not be in business a year from now, much of what was shown was demonstrable and backed by proven vendors. The names associated with optical storage included Eastman Kodak Co., Control Data Corp., Hitachi America, Ltd. and Maxtor Corp.

There were probably a half-dozen robotic or jukebox-style sub-systems running in mechanical demonstrations. Dozens of other vendors showed media and drives ranging in size from 3 1/4 to 14 in.

It appears that most of the legiti-

Pyramid answers DEC with RISC-based superminis

By Donna Raimond

MOUNTAIN VIEW, Calif.—Pyramid Technology Corp. has introduced two reduced-instruction set computer (RISC)-based 32-bit superminis designed to commercial data base and scientific software development users.

The Series 9000 systems are a response to Digital Equipment Corp.'s successful VAX series and to IBM's recent 8370 announcement, said Brian Daly, supermini-computer analyst at Datapro Research Corp. based in Delran, N.J. Pyramid compares the systems to the VAX 8700 and 8800 models.

The 9810 and 9820, which can contain up to 128M bytes of memory, use Pyramid's second generation of RISC processors. Like earlier Pyramid systems, they use off-the-shelf transistor-transistor logic processors with 100-nsec clock times, but the 9810 and 9820 include an added stage to the instruction pipeline to reduce

register-to-register execution time from two cycles to one cycle, according to Paul Lego, manager of product marketing. The processors contain 128 instructions.

The 9810 and 9820 are single- and dual-processor systems, respectively. They can be expanded to support 256 users and more than 16G bytes of disk storage. The dual-processor model is a tightly coupled, symmetrical system.

Both models run under Pyramid's OSX operating system, which is a dual port of the University of California at Berkeley Unix 4.2 and AT&T Unix System V versions of Unix. They support 14 Unix-based data base management systems from companies such as Oracle Corp. and Relational Technology, Inc., which Pyramid says makes both models suited for on-line transaction processing applications.

Although the company is trying to spread out into the commercial mar-

"Parallelism is the most significant development since the stored program computer, and we don't know how to use it."

— C. Gordon Bell, assistant director, National Science Foundation Computer Science and Engineering Directorate, in a speech to the Fall Joint Computer Conference

CDC line to target CAD/CAM

Integrates graphics, CPU in Unix-based Cyber

By Eddy Goldberg

DETROIT—Control Data Corp. has introduced its first Unix-based graphics workstation, the Cyber 910-300.

The 910-300 is the premiere model in a planned family of Unix-based graphics workstations that CDC views as a platform to support existing and future computer-aided design and manufacturing (CAD/CAM) requirements into the mid-1990s.

The Cyber 910-300 is based on the Iris 3100 from Silicon Graphics, Inc. of Mountain View, Calif., under an OEM agreement with CDC, according to Alan M. Christman, general manager of strategy and communications for CDC's Computer-Integrat-

ed Manufacturing division.

The system is intended for use with CDC's integrated computer-aided engineering and manufacturing (ICEM) system of CAD/CAM hardware and software. It was demonstrated at the recent Autofact '86 conference and exposition.

Christman said the 910-300 is the first CDC workstation in which the graphics and central processors are integrated. "There is a direct channel connection between graphics processing and application processing," he said. The system also reportedly features integration of communications support, peripheral support and operating software into a single unit. The operating system is AT&T's Unix System V Release 3.

In addition to an industry-standard Ethernet local-area network interface and a VME bus, the 910-300 features 4M bytes

See CDC page 26

Xerox workstation bows

By Rosemary Hamilton

STAMFORD, Conn.—Xerox Corp. plans to market an engineering workstation based on a Cimline, Inc. processor and software that will replace its current Professional Mechanical System.

The 2285 Engineering Workstation, which runs under the University of California at Berkeley's Unix Version 4.3, has a base price of \$14,900. A color version starts at \$19,190.

While the system is said to be compatible with the Professional Mechanical System, which is based on a Motorola, Inc. 68000 microprocessor, Xerox has not yet determined whether an upgrade package will be available to current users, said Arthur Zuckerman, a company spokesman.

The 2285 includes utilities such as multiple windows, pop-up menus and

graphic icons. It also supports the Xerox Networking System protocol and Transmission Control Protocol/Internet Protocol, enabling it to communicate via an Ethernet network.

Targeted at mechanical engineers, the 2285 runs Cimline Pro Cad computer-aided design software, which will be licensed separately for \$6,495.

A entry-level system comes with a 19-in. monitor, a 68020-based CPU and Motorola 68881 floating-point coprocessor and 4M bytes of memory, expandable to 12M bytes. Memory can be added in increments of 4M bytes, which cost \$3,795 each. Each system comes with a storage module that contains a 960M-byte Winchester disk drive with one of three options: a 1M-byte floppy disk drive, a 40M-byte tape cartridge or a second 96M-byte hard disk drive.

Optical computers could shatter processor performance barriers

By Karl Reed

DALLAS—Optical computer systems offer computer designers a chance to break away from the von Neumann bottleneck that has become a limiting factor in CPU design and performance, according to a researcher from AT&T Bell Laboratories, Inc.

"The modern computer design concept was developed as a means of avoiding the need for vast amounts of parallel connections in the implementation of a computer. However, it turns parallel operations into serial ones," researcher Alan Huang said during a presentation at the recent Fall Joint Computer Conference.

"But God did not decree that all computers should be built thus, despite what many current designers

say. It would be far better to have some means of allowing many parallel connections. But this is not possible with physical wires and is even more difficult with integrated circuits," Huang added.

Huang claimed light waves do not suffer the same restrictions and that it is possible for multiple light beams to pass through a single optical medium without interfering with each other, thus making massive parallelism possible. He also maintained that the basic building blocks for optical computers are already available, noting, "We could build one now but we have to be able to get over that a factor of 10-speed improvement."

The researcher, who claimed to have developed a net of computation

ond for two-dimensional objects.

The system, which uses a Motorola, Inc. 68020, is available now and can use any Unix-based CAD/CAM application software, Christman said. "Users can communicate and pass files between this system and other Cyber systems," he added. For example, a user can create a model on the 910-300 workstation, analyze it on a larger Cyber system and pass it back to the 910-300 for display. CDC's KICM application software will be available for the 910-300 in mid-1987, Christman said.

Prices for the 910-300 workstation start at about \$40,000. A base system includes a 19-in. monitor, 4M bytes of main memory, a 72M-byte disk, Ethernet controller, eight bit planes, a C compiler, editor, linker and extended file system.

Optical systems can break barriers

From page 25

rules that allow optical processing to be effective, said that vastly increased processing speeds — up to 100G floating-point operations per second — would be possible with optical processing.

He also said there is an absence of skew in optical processors. "Digital signals are delayed by different amounts in a computer, and handling this skew is one of the major design problems and limits performance. Optical signals can be processed through a single logic element with a skew of about 10 femtoseconds, eliminating the skew problem," Huang said, noting that a femtosecond equals one millionth of a nanosecond.

IBM adds supplemental printer for small jobs

Designed as low-usage tool for System/36, 38

By James Connolly

CHARLOTTE, N.C. — IBM has introduced a light-duty printer designed to off-load small print jobs from primary printers attached to IBM System/36 and 38 minicomputers.

The IBM 4210 nine-wire dot matrix printer was designed as a low-usage complement to a systems or workstation printer such as the IBM 4224 or 4234, with the 4224 or 4234 being reserved for larger data processing tasks. IBM officials said the

4210 would handle off-loaded jobs such as brief reports, letters and memos.

In large office settings where remote printers are needed, the 4210 can be placed up to 5,000 feet from the host and attached via twinaxial cable. The printer reportedly resembles the IBM 4202 Proprietary XL, which is IBM's wide-carriage printer for the IBM Personal Computer. It reportedly allows cut-sheet paper and envelopes to be inserted without removing single-part continuous paper.

The printer, priced at \$1,800, was designed to print up to 200 char./sec. in data processing mode and up to 40 char./sec. in near-letter-quality mode, with the print modes being se-

lected from the operator control panel or the host application. Developed and manufactured by IBM's Information Products Division in Charlotte, the printer is available now.

IBM also announced a multipen plotter designed for use with the IBM RT Personal Computer and other IBM PCs. The 6184 Color Plotter was designed as an entry-level plotter and is supported by IBM's computer-aided design and manufacturing applications, Cadam, Inc.'s Professional Cadam and various other third-party packages.

The plotter, which costs \$5,400, features a 7.4M-byte data buffer and an eight-pen carousel with automatic pen changing and pen capping.

SYSTEMS & PERIPHERALS

Optical storage comes of age

From page 25

mate vendors have channeled their enthusiasm about optical storage. They seem to recognize optical storage's limitations as well as its capabilities.

For example, Kodak officials billed their 6.80-byte, 14-in. optical-disk subsystem as being suitable for use with superminicomputers and mainframes.

But those same officials note that they do not see the product replacing magnetic storage. Optical technology, at present, does not offer the performance in terms of access times or, in the case of the large disks, the

erasability that magnetic disks provide.

Vendors at Comdex did not seem to be promising all things for all people or claiming that tiny, specialized markets will carry the day for optical systems, as some start-up vendors were saying about two years ago.

Instead, exhibitors seemed to be concentrating on how optical storage can work in conjunction with magnetic storage.

They said optical technology can work well as a random-access storage device in commercial data base applications and in image processing applications — jobs where the price per megabyte of an optical drive jus-

tifies slower access times and write-once limitations.

In cases where the proposed applications may be relatively new, such as image processing, it is clear they are significant markets.

99

Kodak officials note that they do not see the product replacing magnetic storage.

Thus, it may be that optical storage is years away from replacing magnetic tape in most backup situations and many more years away from bumping magnetic disk drives out of interactive computing

applications.

However, it is becoming clearer that optical storage can carve out its niche in the industry and that vendors are closer to being able to serve that market.

THE HARDEST PART OF STARTING YOUR PC NETWORK WITH AT&T'S STARLAN.

Opening the box is about as hard as it gets. After that, all you have to do is plug an AT&T STARLAN Network Access Unit card into an expansion slot in each of your PCs. Then connect the PCs using ordinary modular phone cord.

Next, install your AT&T Network Program, and just like that your independent-minded standalone becomes a team player ready to share information, software and high-priced peripherals.

As many as ten computers can be linked together this easily. And because there's no expensive central equipment to buy for this basic Daisy Chain configuration, your start-up costs are kept to a minimum.

Expanding your network is easy too. Thanks to STARLAN Network's modular design, you can do it with standard telephone wiring and a Network Extension Unit. So up to one hundred users spread across an entire department can work more productively together.

Your departmental STARLAN Networks can also be linked by connecting them to AT&T's powerful Information Systems Network. So virtually all the information processing equipment throughout your company, from PCs (using MS-DOS or UNIX operating systems) to mainframes, can be part of a fully integrated, cost-effective system.

STARLAN Network is backed by AT&T's century of networking experience. It's efficient, reliable, and available now. To find out how to take your first step towards a total networking solution, contact your AT&T Account Executive, your authorized AT&T supplier or call 1 800 247-1222.

Pyramid links 98XE systems to varied PCs

By Peggy Watt

MOUNTAIN VIEW, Calif. — Superminicomputer manufacturer Pyramid Technology Corp. will reach into the microcomputer world with a product line that links its own systems with other vendors' diverse personal computers on the same network.

The Pyramid Connection is a series of integrated networking products built around Pyramid's systems as hosts and connecting to IBM Personal Computers and compatibles, Apple Computer, Inc. Macintosh networks and Sun Microsystems, Inc. units.

Pyramid will resell communications products from Kinetics, Inc. in Walnut Creek, Calif., and Centram Systems West, Inc. based in Berkeley, Calif., as well as certain Sun models as part of the Pyramid Connection, said David Gewirtz, manager of strategic marketing and business development.

For Pyramid, this is an unusual move," Gewirtz noted. The PC and Sun links are through Unix and Ethernet, and the Macintosh connection is by an Ethernet/Appletalk gateway.

PC networking software

A Pyramid 98XE with software for PC networking with 16 PC-NFS links to Sun workstations and 16 Unix terminals, configured with a 470M-byte hard disk, tape backup and 4M bytes of memory, costs \$161,270.

The same Pyramid 98XE configuration with software to support up to 31 Macintoshes through Ethernet/Appletalk costs \$161,634.

Kinetics' contribution is its Fast-path Appletalk/Ethernet gateway, which enables Appletalk networks, such as those running Macintoshes, to communicate with a Pyramid host.

Pyramid implemented a Unix version of Centram's TOPS distributed file system to link Macintoshes and PCs.

Pyramid RISC superminis out

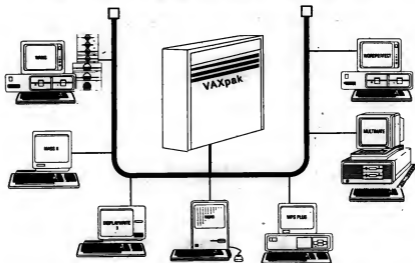

From page 25

ket, it has been better received in the university and research areas, Data-pro's Daly said.

A standard configuration of the single-processor 9810 costs \$200,000. According to the vendor, this configuration includes 16M bytes of memory, 16 RS-232 ports, a 470M-byte Winchester disk drive, a 1/4-in., 100 in./sec. streaming tape drive, a system console, Ethernet and an OSX license for 16 users.

The dual-processor 9820, in a configuration that costs \$300,000, includes the same memory and storage as the 9810 but is ported and licensed for 32 users. Both systems will be available in first-quarter 1987.

DEC provides connectivity.

KEYWORD VAXpak provides compatibility, regardless of where your documents originate.

Introducing KEYWORD VAXpak.

If KEYWORD can provide document compatibility to an environment as complex as this, think what it can do for you.

KEYWORD VAXpak solves the compatibility problem regardless of where your documents originate. PCs, dedicated word processors, Macintoshes, VAXs, VTs, or all of them combined, VAXpak provides total Editable Document Exchange (EDE) among dissimilar systems.

KEYWORD's library of bi-directional translation software eliminates post translation editing. It's the largest in the industry so now you can achieve

KEYWORD VAXpak

SUPPORTS THE FOLLOWING SYSTEMS:

ASCII	AES/LANER
COM/FILE	CONVERGENT/DEF
DEC/EX	CPT
IBM DCA(R/T)	DECIMATE
IBM DISPLAY/WRITE 2/3	EXODIN
MAGS 11	IBM
MICROSOFT WORD	DISPLAYWRITER
MULTIMATE	IBM OS/2
NAVY/OF	IBM 5520
OFFICEWRITER	MSI
SAMBA	Q-ONE
WANG (WPC)	PHILIPS/MCOM
WORDPERFECT	WANG
WORDSTAR	WORDPLEX
XEROX (WYETER)	XEROX 880

complete integration of your multi-vendor environment.

VAXpak integrates with DEC's All-IN-1 providing transparent operation that minimizes impact on end users. Or it functions as a standalone application in non ALL-IN-1 installations.

VAXpak will ensure that your installed hardware investment pays off even more with improved office productivity. Maximize the potential of connectivity with KEYWORD VAXpak - the connectivity catalyst.

COMMUNICATIONS

AT&T to sell supplier link with Cad Cam

By Elisabeth Horvitt

The combined sales force of AT&T's Communications and Information Systems divisions will be trained to market a new service from Cad Cam, Inc., which the Dayton, Ohio, time-sharing company claims could help U.S. manufacturers compete more effectively with overseas companies.

Called Wide-Scale Shared Data Operations Management (WSSDOM), the joint AT&T-Cad Cam venture targets manufacturers that distribute components to third-party suppliers. WSSDOM enables manufacturers to minimize overhead and significantly lower the distribution cost of components. The service increases competition by providing a low-cost way for small companies to take part in the bidding process, according to Cad Cam spokesman David Falter.

"Many businesses today use their current suppliers repeatedly, not because they are the best, but because the cost of finding better ones is prohibitive," Falter explained. "A lot of them think they have to go offshore for inexpensive components. We hope to help U.S. suppliers produce parts more cheaply and allow small suppliers access to bids they otherwise couldn't consider by minimizing their administrative costs."

WSSDOM also improves the efficiency and accuracy of supplier-manufacturer communications by enabling manufacturers to provide suppliers with graphic representations of design specifications, Falter noted.

The joint venture "enables AT&T to play in the CAD/CAM [computer-aided design and manufacturing] industry without having to sell physical CAD/CAM hardware," said Allan Torrey, AT&T market manager.

A manufacturer wishing to distribute a component would send the request for proposal (RFP), along with technical specifications and graphics, to Cad Cam's data base over AT&T lines, Falter explained.

See AT&T page 32

Tandem gives PCs local ride

Multilan ties processors through IBM's Netbios

By Stanley Gibson

CUPERTINO, Calif. — Tandem Computers, Inc. last week announced Multilan hardware and software that allows IBM Personal Computers on a local-area network (LAN) to access Tandem fault-tolerant on-line transaction processing systems.

"This is not another LAN, but a way to integrate PCs with Tandem systems through a variety of LANs," said Dennis McEvoy, Tandem vice-president of software. McEvoy claimed a Tandem computer used as a file server in the system is the first fault-tolerant distributed file server in the industry.

Multilan provides products that connect Tandem systems to IBM's Token-Ring Network, IBM's PC Network, Ungermann-Bass, Inc.'s Net/One, Sytek, Inc.'s System 6000 and other LANs that are based on the IBM Netbios software interface, according to McEvoy. PC users can gain access to Tandem files using IBM PC-DOS and Micro-

soft Corp. MS-DOS commands, he added.

IBM has yet to announce gateways for its own System/38 fault-tolerant computer to any PC network. Stratus Computer, Inc., which manufactures the System/88 for IBM, said it offers no direct PC to LAN links, although it intends to do so in the future.

Tandem also introduced Wordlink software, which uses IBM's Document Content Architecture (DCA) to provide document exchange between incompatible word processing systems. Incorporating document translation software licensed from Soft-Switch, Inc., Wordlink can operate both in batch and interactive modes. As a document formatting protocol developed by IBM, DCA is supported by a growing number of vendors as a common interim format for translation between incompatible word processing systems.

In a typical application, Wordlink can enable Wang Laboratories, Inc. VS 100 or Office Information System workstations to send reusable form documents to an IBM Displaywriter or IBM PC via a Tandem system, according to the vendor.

Omri Serlin, president of Icom International, said Tandem page 30

INSTANT ANALYSIS

"The buyer would like to say to IBM or Digital Equipment Corp., 'C'm me, but there are no generic computer-integrated manufacturing solutions. Users are looking for things we can't offer yet.'"

— John Chaney, president, McDonnell Douglas Manufacturing Systems Co.

Micros get Bridge over Token-Ring

Terminal emulation, file transfer access hosts

By Elisabeth Horvitt

SAN FRANCISCO — Bridge Communications, Inc. unveiled terminal emulation and file transfer software that enables IBM Personal Computer users to access multiple hosts across an IBM Token-Ring network. The introduction was made at the Localnet '86 conference held here last week.

IBM PCs running Tokenterm software can emulate virtually any terminal, accessing a variety of asynchronous hosts via Bridge's CS/1-TR Token-Ring Communications Server, according to the Mountain View, Calif.-based firm.

"We're finding a very high level of interest in the IBM Token-Ring at the PC level, especially since IBM products for connecting the rest of its systems into the Token-Ring are six to 18 months away," said Bridge President William Carro.

The announcement is part of an important trend toward "high-speed, virtual environments in which the PC can access multiple host systems as one," said David Terrie, president of Boston-based Newport Consulting. "By 1990, terminal-to-host revenue will have flattened out, and the real game will be local-area networks providing high bandwidth PC-to-host connectivity."

Tokenterm features a built-in emulator for Digital Equipment Corp. VT100 and VT52 terminals. A program interface also

SYSTEM 2000 DBMS for Only \$12,000

All the Extras Without the Extra Costs

You don't have to spend a bundle to get a full-function data base management system. For a first-year fee of \$12,000, SYSTEM 2000® DBMS gives you:

- an integrated data dictionary
- on-line query/update
- a report generator
- relational data base access
- programming language interfaces
- high-quality training and technical support.

Renewal rates are even lower. Plus, you can now link SYSTEM 2000 DBMS with the SAS® System of software to build data bases, store and retrieve data, merge and manipulate data, perform your analyses, and produce reports and presentation graphics. You can even give Information Center users access to your DBMS through easy-to-use SAS menus.

Before you invest a bundle, find out why SYSTEM 2000 DBMS is the most economical data base management system in the industry.

HOW TO GET SPECIAL PROJECTS DONE WITHOUT TYING YOUR STAFF IN KNOTS.

Now you can get your special data processing projects completed quickly, accurately and cost-effectively without disrupting the workflow of your organization. The solution is project-oriented specialists from Accountemps.

Accountemps data processing professionals are slightly over-qualified. Orientation is short and simple. They fit in with your permanent staff and have the expertise to complete special projects knowledgeably and skillfully. You supervise them just like you do

your own people. And you don't have to divert your permanent systems analysts, programmers, operators, and data entry personnel from their regular assignments.

The result is that you meet your deadlines, get a professionally done job and save time and money.

Call us the next time you have a special project. We'll send you a data processing specialist, or a team of specialists to pitch in for a day, a week, a month or longer.

Rely on Accountemps. You'll be glad you did.

OSI compiler simplifies applications building

By Peggy Wott

SANTA BARBARA, Calif.—Communication Machinery Corp. last week announced an advanced compiler that reportedly simplifies the task of developing applications that support the Open Systems Interconnect (OSI) protocols. OSI, developed by the International Standards Organization, is an emerging standard that provides hooks for various communications applications, such as file transfer and electronic mail.

Communication Machinery's new ASN.1 compiler codes and decodes data packets directly from C-language structures, enabling OSI applications programmers to sidestep the laborious task of manually encoding the protocol data units in a very complex language syntax. Abstract Syntax Notation One (ASN.1), according to Communication Machinery, "It allows [OSI] programmers to spend most of their time in C," said product marketing manager Jim Soriano.

According to Communication Machinery, the ASN.1 compiler is intended largely as an implementation for programmers developing systems to work in Manufacturing Automation Protocol (MAP) and Technical Office Protocol (TOP) environments. ASN.1 will target large customers, OEMs and systems integrators that are developing software applications under either MAP or TOP.

The compiler should also ease the programming load of migrating application and session-layer protocols from existing MAP Version 2.1 and TOP Version 1.0 implementations to the future MAP and TOP Versions 3.0, according to Communication Machinery President Stephen Holmgren.

The compiler includes libraries that work with various C compilers, and it provides source and object code for rapid updating. Soriano said it was designed to be used with Communication Machinery's kernel protocols of File Transfer and Management and Common Application Services Elements. File Transfer and Management outlines specifications for file transfer, and Common Application Services Elements outlines specifications for program-to-program communications within the OSI protocol set.

The advanced ASN.1 compiler will be available as part of Communication Machinery's new OSI upper layer protocol package, which is priced at \$19,750 plus per-copy royalties for resales.

Current customers of Communication Machinery's File Transfer and Management Systems Elements kernel software will receive the new compiler at no charge. File Transfer and Management 1.0 costs \$15,000, and Common Application Systems Elements costs \$5,750 plus royalties.

Tandem gives PCs local ride

From page 29

tional Co. in Los Altos, Calif., said the new products will enable customers to get added use from their equipment. "The demand is from customers who already use a Tandem mainframe but also have a lot of PCs," Serlin said.

Although the new products will be sold principally to prevent customers, Serlin said additional sales could come in the departmental computing market, especially where the data integrity offered by fault-tolerant Tandem computers is important.

Multilan hardware consists of a dual-ported LAN controller, priced at \$4,000, that resides in the Tandem system and a Multilan attachment device, priced at \$4,000, that provides the connection to the user's LAN. Multilan software consists of file and printer server

software that runs on Tandem systems. The package is available for a \$6,400 initial license fee and a \$300 monthly charge for Tandem Nonstop VLX, TXP and II systems; a \$3,200 initial license fee with a \$150 monthly charge for Nonstop EXT2b; and no initial license fee and a \$75 monthly charge for Nonstop EXT1b.

Wordlink software carries an initial license fee of \$4,000 and a monthly charge of \$150 for Tandem Nonstop VLX, TXP and II systems and a \$75 monthly charge for Nonstop EXT, EXT10 and EXT25 systems.

Optional Wordlink-Wang and Wordlink-DCA and Wordlink-Multilink translators carry a \$4,000 initial license fee and a \$150 monthly charge for Nonstop VLX, TXP and II systems; and a \$2,000 initial license fee and \$75 monthly charge for Nonstop EXT systems.

Multilan and Wordlink products will be available in March 1987.

COMMUNICATIONS

AT&T to sell supplier link

From page 29

The manufacturer can choose not to be identified in the file.

Suppliers on the manufacturer's preferred vendor list are then notified of the RFP via electronic mailboxes in Cad Cam's system. They can call up the listing and view, rotate and zoom the engineering drawings on a personal computer. Hard copies of graphics and text can be printed locally for further review.

Suppliers' quotes are transmitted via AT&T lines to the Cad Cam system, where they are processed and prioritized according to predefined parameters such as cost, past responses to bids and territory, Falter explained.

WSSDOM is based on Telegraphics, a 3-year-old Cad Cam-AT&T venture that enables users to access design data bases residing on Cad Cam computers. Telegraphics supports several standard graphics formats, including Initial Graphics Exchange Standard, Intergraph Corp., McDonnell Douglas Automation Co. and Computervision Corp. Companies without CAD/CAM systems can use a scanner from Medigraphics to digitize hard copy drawings and send them to the Cad Cam data base.

Selling the concept

The WSSDOM concept initially must be sold to manufacturers "with a critical number of suppliers," Falter said. Once a manufacturer signs on, AT&T's joint sales force would market the WSSDOM concept to suppliers that would respond to that manufacturer.

AT&T recently received permission from the Federal Communications Commission to mesh the Information Systems and Communications divisions' sales, marketing and customer support forces.

Customers will initially be connected to WSSDOM via AT&T WATS lines, Torrey said. Dedicated lines and packet-switching connections will probably be used in the future, he added.

WSSDOM availability is scheduled for the spring of 1987.

Ungermann-Bass links Ethernet, Token-Ring

Data Link Bridges broaden Net/One

By Elizabeth Harvett

SAN FRANCISCO — Ungermann-Bass, Inc. has broadened its Net/One network-to-network connectivity line with Data Link Bridges that support a wide

range of upper layer protocols, the vendor said.

The Data Link Bridges enable users on two different networks to exchange data and share resources. The introduction included two local bridges that connect physically adjacent local-area networks (LANs); the Ethernet-Ethernet Data Link Bridge and the Token-Ring-Ethernet

Data Link Bridge. Both bridges can connect multiple networks through a common broadband backbone, Ungermann-Bass said.

Local bridges relieve network congestion by ignoring all locally addressed packets on a LAN and forwarding only those packets that are addressed to nodes on the other network, Ungermann-

Bass said. This enables companies to divide an overburdened LAN into two networks, each of which supports a group of users that communicate most often with each other and only occasionally with the other group.

Ungermann-Bass also unveiled two remote bridges. See **TOKEN-RING** page 33

Would your PC software

1. Does your software include programs for easy access to mainframe information?

2. Can your spreadsheet consolidate additional spreadsheets then retrace your steps so auditors can find what they're looking for?

3. Can you draw 12 different kinds of graphs, size and position them, put them side by side (4 to a page if you need to) and preview before printing?

4. If you have a mainframe connection, can you share information with those who should see it, and protect it from those who shouldn't?

5. Can you link a series of commands that will automatically update and assemble comprehensive reports month after month?

6. Can you personalize your document by redesigning the layout, or the look of the type, and adding color?

7. Can you access a mainframe, store and organize information with a database manager...

...analyze it with an auditable financial model or spreadsheet...

...present your numbers in lots of different kinds of charts and graphs...

...customize your document, write whatever text you need...

...then take all the work you've done and put it on the same page...

...without scissors, tape or a manual on computer programming?

ports a range of third-party terminal emulation programs, including Hewlett-Packard Co. HP 2392 and 2623 emulation from Walker Richer & Quinn, Inc.; Tektronix, Inc. 4105 emulation from Grafpoint; and Data General Corp. Dasher 210

emulation from Performance Consulting Group.

Tokenterm competes directly with a similar introduction that Ungermann-Bass, Inc. made at Locainet [CW, Nov. 17]. "Bridge and Ungermann-Bass are pretty much head to head, although Ungermann-Bass emphasizes direct sales, and Bridge concentrates on OEMs," Terrie said.

Priced at \$300, Tokenterm is available 30 days after receipt of order.

Token-Ring Ethernet link

From page 32

The Ethernet Remote Data Link Bridge links an Ethernet or broadband network to a remote Token-Ring, Ethernet or broadband LAN.

The Token-Ring Remote Data Link Bridge connects a Token-Ring network to a remote Token-Ring, Ethernet

or broadband LAN.

Data Link bridges provide faster communications than bridges that operate at higher level protocols, Ungermann-Bass said. The Ethernet-Ethernet

Data-Link Bridge can forward up to 6K packets per second, matching the speed of an Ethernet LAN, the company added.

Both remote bridges handle data rates of between 4.5K and 2M bit/sec. They support RS-232, AT&T 306/V.36 and RS-449 interfaces.

Because they provide connections at the data-link layer or of the International Standards Organization's Open Systems Interconnect (OSI) model, all the bridges transparently support a variety of high-level communications protocols, including Transmission Control Protocol/Internet Protocol (TCP/IP), Digital Equipment Corp.'s Decnet, OSI Protocol and Xerox Corp.'s Xerox Networking System.

Ethernet-Ethernet connections "have the added advantage of allowing multiple vendors' equipment running different upper-layer protocols to be linked over a single internetwork device," said Darrell Miller, Ungermann-Bass director of product marketing.

For example, the same Ethernet-Ethernet bridge can handle communications between DEC VAXs and IBM Personal Computers running Decnet as well as between AT&T Unix System V systems running TCP/IP.

Bridges that link a Token-Ring network with another LAN can handle only one type of upper level protocol, Miller added.

Both the local and remote Ethernet-Ethernet Bridges will be available in the first quarter of 1987. Token-Ring-Ethernet and Token-Ring-Remote Data Link bridges will be available in the second quarter of 1987.

Baseband versions of the local bridges are priced at \$9,495, and broadband versions cost \$10,095. The Token-Ring Remote Bridge and the baseband version of the Ethernet Remote Bridge are priced at \$9,495. The broadband Ethernet remote model costs \$10,095. Software for each model costs \$2,000.

flunk this simple test?

Try to build a document like this with most popular software programs and you'll be stuck cutting, pasting or studying computer languages. The IBM Personal Decision Series (PDS) makes no such demands.

PDS not only does a lot of jobs well, it combines all of them easily. It's a team of six powerful programs (or Editions), which unlike all-in-one packages, don't have to be bought all at once. You can get some of the programs or all of them, depending on your needs.

DATA Edition is where you begin. It's a flexible database manager that organizes a lot of information, and takes it from a variety of sources. When you use the HOST ATTACHMENT Edition you can get valuable information from an inside source—the central computer—without having to rekey it all.

Add PLANS+ and you can answer "what...if" questions with a financial model or spreadsheet, which let you remember how you arrived at your answers.

You can transform your numbers into different shapes, sizes and colors by using GRAPHIS. Or customize your document by making layout and type style decisions with REPORTS+.

WORDS helps you get your point across with an easy-to-learn word processing program. (PDS even works with IBM Display Write.) Then you can combine all the work you've done into one document with a few keystrokes.

It's that simple.

If you can't do it that simply, you're doing a lot of work by hand your software should know how to do by heart.

For more information on PDS—the software solution that puts it all together—call an IBM marketing representative,

or visit an Authorized IBM PC Dealer. For the store nearest you, and a free brochure, call 800-447-4700.

INGRES.

The Distributed Database Solution.

The Distributed Database.

With INGRES, you get a truly distributed database. Not just a networked system. Because INGRES is the one RDBMS that works across multiple operating environments. From mainframes to minis to micros. Whether you have a few computers or a few thousand. Which means no matter how large your organization, your data and your applications can be shared. You'll have one consistent relational view of all your data.

The key to your distributed database is INGRES/STAR. Its open architecture gives you universal access to data (supporting multiple vendors' hardware, software and networks), while preserving local control of data integrity and security. Users don't have to worry about where the data is located, how to get it or what type of hardware and operating system are used.

Which means you can build applications and share data that span multiple computers just as easily as if all the data were located on one machine. Your entire company uses one powerful DBMS with consistent, reliable results.

Integrated Application Tools.

Only INGRES gives you a comprehensive application development environment. With a 4GL that includes SQL, a Visual Forms Editor and host language interfaces

(ADA, BASIC, C, COBOL, FORTRAN, PASCAL and PL/I). You'll work in an integrated environment that gives you unprecedented productivity in application development.

Your end-users will find it easy to create forms, queries, reports and graphs, too. Because INGRES's Visual Programming tools give them the decision support capabilities they need. While reducing the MIS application backlog.

High-Performance SQL And More.

INGRES's SQL is broadly compatible with IBM's DB2. So you can stay with the industry standard. And move applications easily and quickly, whenever you want.

You can also count on higher performance. INGRES is uncommonly fast. And provides special support for transaction processing and complex queries. What's more, INGRES gives you the high levels of data security, integrity and consistency you demand.

So look into the only truly distributed relational DBMS solution. INGRES. You'll see how the INGRES advantage is the key to integrating your dissimilar computers. For more information, call toll-free:

A spreadsheet for all reasons

Lotus Development Corp.'s 1-2-3 so successfully established itself as a standard for spreadsheet processing that even the firm's own Symphony made limited progress in displacing 1-2-3.

In fact, the standard set by 1-2-3 was so effective many 1-2-3 users have stayed with the earlier Release 1A instead of converting to the current 2.0 version.

One of the more interesting events in the past year or so has been the appearance of a growing number of 1-2-3 Release 1A-compatible products.

A system with quite a lot to offer users in Lifetree Software, Inc.'s Words & Figures. Completely compatible with 1-2-3 Release 1A, Words & Figures includes many of the capabilities of 1-2-3 Release 2.0.

What most distinguishes the package, however, is the inclusion of a quite reasonable medium-function word processor.

Lifetree's major product prior to Words & Figures has been Volkswriter, a fully featured word processing program. The word processing in Words & Figures is quite separate from Volkswriter's and does not contain all the features of Volkswriter and other dedicated word processing packages.

It does, however, provide all the basic capabilities that most business users will require and, most important, makes it easy to combine spreadsheet data into documents.

Lifetree is quite justified in billing Words & Figures as "the spreadsheet for people who want to write about their numbers."

Spreadsheet cells can be directly inserted in text created with the Words & Figures.

See SPREADSHEET page 36

Tool widens MS-DOS uses

Offers MC68000-based systems compatibility

By David Bright

LAS VEGAS — Phoenix Technologies, Ltd. recently announced a software emulation product for running Microsoft Corp. MS-DOS on Motorola, Inc. MC68000-based systems and other non-IBM Personal Computer-compatible systems.

Speaking at Comdex/Fall '86, Rich Levandov, vice-president of strategic operations, said that manufacturers could begin offering the Soft Coprocessor for their systems by March or April. Phoenix will begin shipments to OEMs sometime in the first quarter of 1987. Phoenix said it hopes that manufacturers of 68000-based products, such as Apollo Computer, Inc., Hewlett-Packard Co. and Sun Microsystems, Inc., will use the product to add MS-DOS compatibility to their workstations and systems without additional hardware.

"The goal is complete PC compatibility on any other computer that sells for below

\$50,000," Levandov said. "It's the universal workstation coming into being."

One problem that the product may have is slow performance, but Phoenix is intending the product for occasional IBM PC applications users. Levandov said the applications should be able to run nearly as fast as they would on a basic IBM PC.

According to Phoenix, the Soft Coprocessor provides a complete IBM PC XT-compatible environment supporting all existing I/O controllers. In systems containing the required floppy disk drive controllers, the software supports all IBM PC applications; in systems without floppy disk hardware, it supports most copy-protected and all unprotected software.

The Soft Coprocessor is an extension of Phoenix's coprocessor product line, which utilizes a combination of board-level hardware and communications and emulation software to integrate IBM PC-compatibility to incompatible systems. The Soft Coprocessor is said to include emulation software that remaps the Intel Corp. processor instruction set to the host system's native processor.

Oracle brings SQL to casual user

By Douglas Burney

LAS VEGAS — In an attempt to bring SQL to the masses, Oracle Corp. unveiled EasySQL, an end-user interface for the firm's Oracle data base product line.

Although EasySQL does not provide a full implementation of SQL, it provides much of the functionality of a fuller featured, but more difficult to use, SQL interface. "We have selectively made portions of SQL accessible to the naive user," said Eugene Shklar, director of marketing for Oracle's PC product line. "It takes advantage of some of the functionality that is built into the SQL language."

Oracle is aiming the product at novice and casual users of its data base products. Many of these users infrequently query data bases, and may have difficulty learning and retaining knowledge of SQL procedures. "Training does not do a whole lot of good because of infrequent use," said Kenneth I. Cohen, director of product marketing for Oracle. "We are trying to create autonomous casual users of the system," Cohen said.

The system provides ad hoc relational

queries, as well as data base table creation and maintenance, color graphics and report writing. The system also uses a fill-in-the-blanks technique for data entry and updates. EasySQL also allows users to access other Oracle programs, such as SQLCalc, an Oracle spreadsheet program. According to the firm, EasySQL achieves ease of use through pop-up windows and point-and-select techniques. The system provides automatic hints and context-sensitive Help.

EasySQL will ship next month and will initially be available on IBM Personal Computers and compatibles as well as on Digital Equipment Corp.'s VAX minicomputers and Microvax line. Next year the product will be available on other micros, minis and mainframes.

EasySQL sells for \$395 as an add-on and will cost \$995 when sold with the Oracle data base that runs on IBM PCs and compatibles. On DEC's VAX line, the product will cost from \$1,000 to \$18,000.

There are currently some 15,000 licenses for Oracle on PCs, company officials said.

INSTANT ANALYSIS

"IBM isn't here to say anything about Topview or what, if anything, they're going to make proprietary."

— Stephen Hysick, applications engineer for Acco Babcock, Inc. and Comdex/Fall '86 attendee, on the lack of information on IBM's future Personal Computer strategy

Quadram graphics board offers more than IBM's EGA

Product based on Intel's 82786

By David Bright

LAS VEGAS — Quadram Corp. recently announced an IBM Personal Computer XT-compatible high-performance graphics board — one of the first boards based on Intel Corp.'s 82786 graphics coprocessor.

The board was presented at Intel's 80586 and 82786 product showcase at Comdex/Fall '86. Called QuadHPC, the card reportedly provides twice the resolution, 16 times the color se-

lection and up to 100 times the speed of IBM's Enhanced Graphics Adapter (EGA), a new standard board introduced two years ago.

According to James Rush, Quadram Graphics Products Division manager, the board transforms an IBM PC XT or AT system into a true graphics workstation.

Four resolution modes

The QuadHPC supports four resolution modes: 640 pixels by 300 pixels (IBM Color Graphics Adapter); 640 pixels by 350 pixels (EGA); 640 pixels by 480 pixels (Professional Graphics Controller); and 640 pixels

by 480 pixels for RS-170A red-green-blue display, according to the company.

The board can display up to 256 colors from a palette of more than 16 million colors. A drawing rate of 2.5 million pixels/sec. enables the board to display up to 25,000 char./sec. It has an area fill rate reaching 3.75 million pixels/sec.

For display refresh, character fonts and display listing, the board carries between 512K bytes and 2M bytes of standard dynamic random-access memory. It supports both analog and digital data output and is compatible with either an 8-bit or 16-

bit data bus interface. The board's analog resolution is 1,280 by 960 pixels, according to the company.

Pricing has not been set. Delivery will begin in early 1987, Quadram said.

Other new 82786 products at the showcase were a graphics card under development by Number Nine Computer Corp. and a workstation from MAD Intelligent Systems, Inc.

MAD's D3000 system for bridging artificial intelligence and data processing environments includes both the 82786 graphics coprocessor as well as Intel's 32-bit 80386 microprocessor.

MICROCOMPUTERS

A spreadsheet for all reasons

From page 35

Figure word processor and are live.

That is, if you go back and make modifications to the original spreadsheet, those changes are automatically reflected in the cells that are included in the document.

Writing a memo on a busi-

ness plan with the figures included in the text is easily and conveniently done.

The split screen capability of Words & Figures lets you work with a document and the spreadsheet at the same time. Switching back and forth between the two is handled with a simple function key switch.

Integrating spreadsheets

This greatly simplifies the process of integrating portions of a spreadsheet with

text.

Words & Figures has a lot of handy spreadsheet features as well.

Like Lotus's 1-2-3 Release 2.0, Words & Figures includes an Intel 8087 math coprocessor and expanded memory support. It also uses a sparse matrix technique for handling spreadsheets in memory.

The last feature makes it possible to handle much bigger spreadsheets than would otherwise be feasible.

Both the IBM Enhanced Graphics Adapter (and compatibles) as well as the Hercules Computer Technology, Inc. monochrome graphics specification are supported. A spreadsheet audit capability is also included.

Detection of errors

The audit capability will detect possible circular references and identify the sources of Error and Not Available results, which can be a handy feature in work-

ing with complex spreadsheets.

In addition, Words & Figures contains graphics output capabilities that represent a significant enhancement of those in the Lotus 1-2-3.

The software supports a large selection of printers. In addition, the Words & Figures Plotprint program provides 10 different type fonts and supports Postscript printers, resulting in more options for producing attractive graphics output.

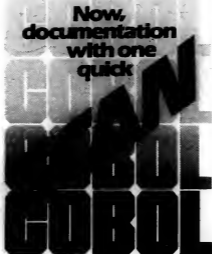

All of this, of course, works perfectly well with existing Lotus 1-2-3 Release 1A spreadsheet files.

Words & Figures's word processing capabilities and spreadsheet enhancements thereby become available for use with data already in hand for the typical 1-2-3 user.

A minor feature that I particularly appreciate is a built-in cursor key accelerator.

”

Lifetree is quite justified in billing Words & Figures as "the spreadsheet for people who want to write about their numbers."

SCAN/COBOL takes the effort out of program documentation. Nothing's more important to document than source code, but nothing gets done less.

Now SCAN/COBOL will automatically document any COBOL program—no matter how long or complex—in the source code, where it's most effective.

No matter how many changes you make, SCAN/COBOL keeps all your source level documentation up-to-the-minute. Whether it's your own COBOL program or a vendor's, SCAN/COBOL gives you the critical information you need—whenever you need it—in clear, easy-to-follow form.

And SCAN/COBOL guarantees that all your source code gets documented in exactly the same way. Programmers will become productive sooner, develop reliable programs faster, and maintain them easier.

SCAN/COBOL does what no other analysis tool can. It simulates the execution of every cleanly compiled program. SCAN/COBOL saves hours and hours of testing and computer time by giving you critical information that shows how your program will run. It highlights poorly structured code in simple, concise graphs; pinpoints the illegal use of keywords; and reveals hidden bugs and maintenance hooby-traps—all before the program runs.

Call Cheryl Maloney today at (202) 887-5420

When you hold down one of the cursor control keys, the cursor movements speed up if you continue to hold the key down.

Although this may seem like a minor point, it is a welcome feature in practice.

Perhaps best of all, however, is that Words & Figures is not copy protected.

As far as I am concerned, the program is worth having just for the benefit of doing away with the stupid and annoying inconvenience of having to use a key disk to start the program.

I don't know what you, but I strongly resent having silly and unnecessary tasks imposed upon me for the protection of the software vendors.

All things considered, Words & Figures is a nicely designed program that offers a lot of value for the price. At \$195, Words & Figures is well below the \$495 price ticket on Lotus's 1-2-3 Release 2.0, and is in equal or ahead in most spreadsheet features.

So, even without the word processing capability it would be a reasonable alternative.

With that, Words & Figures looks like a terrific value for users and may, in fact, give the Lotus 1-2-3 a serious challenge.

In addition, Lifetree offers site-licensing options for businesses.

Where do you find a database with the power to make pictures?

Computer Corporation of America.

Now you can incorporate pictures right into your mainframe database management system, retrieve them selectively, and transmit them to wherever they're needed.

Instantly.

Because now, the unique architecture of Computer Corporation of America's Model 204 DBMS makes Picture 204 possible.

And with it, your Model 204 database can take on new visual tasks such as employee identification and certification, documentation, or filing anything where pictures or scenes are of importance. In full color or black and white.

No longer is the computer limited to text, numbers and charts, and graphs. Because an inexpensive video camera can pick up images directly from people or objects. Or, images can come direct from VCRs or video disks. And Model 204's tremendous capacity means you can store almost infinite amounts of pictorial data integrated in the same records as your usual data.

Images and text can be recalled by whatever attributes you select. With pictures of TV quality or better that can be transmitted by phone, direct connections or local area PC networks.

Sound incredible? It is.

It may be the biggest advance in computer use since fourth generation language. (Which we invented almost 20 years ago.)

Don't take our word for it. Send the coupon and get the whole picture. Or, call John Donnelly at 1-800-258-4100, ext. 702.

Please send me the complete story on Picture 204.

Plus enhances Hardcards to run on Intel 80286 systems

Programmable ROM BIOS chip included

By Peggy Wirtz

MILPITAS, Calif. — Plus Development Corp. recently announced an upgrade kit to enable its Hardcard 20 hard disk on a card to run on Intel Corp. 80286-based systems.

The 80K-byte Hardcard was previously unable to interact with the BIOS of IBM Personal Computer AT-class machines and could run only on Intel 8088- or 8086-based systems, said Wayne Erickson, Plus Development product manager. The \$50 80286 Upgrade Kit, however, includes a BIOS programmable read-

only memory chip to ensure compatibility and provide hooks to the AT-compatible operating environment, he said.

Similar products from other vendors that put hard-disk technology on expansion cards are currently available only for 8088- and 8086-based systems.

According to Plus Development, installation is relatively straightforward, with the Hardcard user first removing the existing BIOS chip from the card with a tool included with the kit.

The kit also includes a software program to be run once to change the Hardcard's BIOS interactions.

"It's really a software change, so the upgraded card will work in both

the 8088/86 and 80286 environments," Erickson said. The upgrade will be available in mid-December.

Several users said they have been waiting for Hardcard support of 80286 systems. John Molloy, manager of data center operations for Liberman Bank in San Francisco and a beta-tester of the original Hardcard, said he has been asking for a Hardcard that would run on his department's half-dosed PC ATs.

"Since the Plus Hardcard only takes up one slot [on the motherboard], we can easily add it if we run out of capacity on an internal hard disk," he said. He originally installed Hardcards on an IBM PC and two Compaq Computer Corp. Portables and said the 80286 support is "some-

thing I think we'd be interested in."

Joe Rogers, finance and administration department manager for Quantum Software Systems, Inc., which owns Plus Development, called the Hardcard "a much more elegant solution" for expanding the capability of his PC AT system.

Plus's Erickson said the upgraded Plus Hardcard will run on the IBM PC AT and 286 XT, Compaq's Portable II and Deskpro 286 and will also work on some clones. A version to accommodate the recently released 80386-based Deskpro 386 is in the works, as is a 30M-byte Hardcard, he said.

The 80286 Upgrade Kit will be sold separately from the Hardcard 20, which is priced at \$865, as an option for 80286-based system users.

Speech Systems announces speech-to-text conversion tool

Phonetic engine for OEMs, end users

By Peggy Wirtz

TARZANA, Calif. — Tools for smooth speech-to-text conversion were announced recently by Speech Systems, Inc., which has developed a microcomputer-based phonetic engine for both OEMs and end users.

The development version of the engine, the DS100, is currently available with a lower cost end-user version, the PE200, to be released

next spring, according to Bill Adams, Speech Systems vice-president of sales.

Both products take an approach different from other speech recognition tools by recognizing not words but phonetic sounds and parts of words, Adams said. Their developers say the products ensure wider use of the speech tools as users will not have to "read in" and define any voice commands in advance or pause unnaturally during speech input.

Speech Systems developers say the phonetic engine offers an alternative for any

input-heavy task, from simple data entry to data base applications or word processing when both hands are busy. "Why would you want to type it when you could talk it?" Adams asked.

Telephone data entry

Adams also said the company has received queries from clients who want to practice data entry or retrieval over the telephone.

Defense contractors and the military have expressed interest in the technology for alternate input systems for pilots or on-line voice com-

mands, Adams added.

Speech Systems phonetic engines come with 30,000-word phonetic dictionaries. According to Speech Systems, the end-user model will be packaged as a speech input peripheral that attaches to the side of an IBM Personal Computer or compatible microcomputer, with a telephone-like handset.

Input translation

Speech input is transmitted to the computer through an RS-232C cable. The hardware includes the Phonetic Decoder software, which translates the spoken input to text on the screen. Package price will be \$5,000, with volume prices available, Adams said.

The development model phonetic engine, the DS100, is packaged in a microcomputer chassis with Phonetic Engine software, plus Phonetic Decoder software, at a cost of \$52,000, which includes development documentation and a license to produce and sell Speech Sys-

tems runtime software.

Although Adams said the products are aimed at value-added resellers and OEMs that will assemble packages with voice input available for vertical applications, Adams expects some large DP shops will also do their own development and tailor the speech input systems to their own tasks.

The initial speech-to-text translation is into ASCII. "This is application-dependent," Adams noted. The product could also run on networked applications, he added.

Although the first version of the Phonetic Decoder is designed for IBM PC and compatible systems, Adams said he expects it will be ported to a variety of systems in the future, from high-end workstations to possibly Apple Computer, Inc.'s Macintosh.

Speech Systems has been developing its speech-to-text tools for five years and now employs approximately 70 workers.

Intellisoft product protects data during power failures

NOVATO, Calif. — A product that protects data during power loss was recently announced by Intellisoft, Inc.

The \$69 package, called Bookmark, is memory resident, automatically records data from random-access memory and saves the data to the user's hard disk. Users can determine how much data the system should save either by number of keystrokes or length of time.

According to the firm, the user can resume work shortly after a power failure, reboot down or an accidental re-

start without loss of data. In addition, a user can power down and upon restart return to the point at which he left off. The firm said that the product eliminates the need for a battery backup and operates faster than conventional reloading.

With the Auto-Resume function, a program that is run overnight can be protected against data loss and automatically restarted.

The package runs on an IBM Personal Computer or compatible with at least 64K bytes of random-access memory and a hard disk.

Executive Report

Computers in retailing: *Shopping for strategic advantage*

By GLENN RIFKIN

For America's shoppers, the change is subtle. Over the past decade, shopping in retail outlets appears to have changed little. Sure, the odd, striped decoration (known as the Universal Product Code) has become commonplace on items in supermarkets, and the old whizzing and banging cash register has gone the way of the dinosaurs. Receipts, if anyone bothers to look at them, now provide a bundle of information that was heretofore impossible to squeeze onto such thin rolls of paper.

And cashiers no longer leaf through countless Mastercard or Visa numbers hoping to spot yours as the delinquent one. They simply slip the card through a magic telephone and punch in a few numbers; within seconds your good name is cleared, and the item is in the bag.

But shopping as an experience hasn't changed all that much. Frenzied bargain hunters still claw through the racks, wanted items are still out of stock, lines at the checkout counter still crawl along. Unobservant shoppers would not notice the impact of computers on the retail business at all.

If anything, they might be annoyed that the cashier now must punch dozens of numbers into the electronic cash register for every item, thus making the checkout lines even slower than in the old days.

Nonetheless, technology has changed the face of retailing dramatically, particularly among large retailers. A huge and varied industry, there are more than two million retail establishments in the U.S. of every shape and form, from general merchandise stores to eating and drinking places. The annual take for this multidimensional industry exceeds \$1 trillion.

Many of the large retailers, such as Sears, Roebuck and Co. and J. C. Penney Co., embraced technology more than 25 years ago and have steadily increased their commitment to computers. As computers have been downsized, retail chains have begun to put more horsepower into individual stores and into the hands of the end users running those stores.

Though small and medium-size retailers are only now looking to technology, analysts believe that market holds vast potential for computer

Shopping for strategic advantage

Continued from previous page vendors to peddle their wares.

For this untapped marketplace, a meeting of the minds between vendors and users is necessary before significant automation takes place on a smaller level. As specialty stores grow in popularity, specialty systems and software are needed to convince owners that automation adds to the bottom line. Both sides can take lessons from what has occurred among the large retailers.

As Herbert Kleinberger, director of retail systems consulting with Management Horizons, Inc. in New York, points out, the systems being used in retail have evolved from simple accounting applications aimed at basic transaction processing to operational systems aimed mainly at planning and control activities and finally into merchandising applications geared toward tracking and managing the buying and inventory management functions.

The function of computers, according to Kleinberger, has shifted away from simply handling routine tasks. He says their use is shifting toward decision-support activities that are aimed at providing management assistance with critical decisions.

Though it is a catchphrase heard throughout industry, the term "strategic" or "competitive" advantage is now being trumpeted for the first time throughout the retail industry. Information systems, from point-of-sale (POS) terminals on the store floor to expert systems running on superminis, are being called upon to help Macy's beat Gimbel's.

At Sears, which opened its first data center in 1962, Charles Carlson, vice-president of information systems, says, "Hardly a portion of our business, either in the field or in the headquarters organization, is not impacted by information systems."

The numbers reflect that. According to market research firm International Data Corp. (IDC), the retail automation market will be valued at nearly \$11 billion by 1988, double that of 1984, with an annual growth rate of 18.8%. And it is not just the large retailers that are looking toward technology.

Jim Larson, an independent retailing consultant based in Evanston, Ill., is urging his smaller clients to consider automation. "A single store, once it gets to over \$1 million in sales, needs to consider getting computerized quickly," Larson says.

"They need to get on top of it because the margins in retail are low, and they need to write every dollar out of their investment. And the competition is getting rough out there."

Despite his warnings, Larson says he believes that small retail operations, \$50 million and less, are still woefully unprepared for the age of technology. He sees computers doing back room functions, such as general ledger or accounts payable, in these businesses but little movement toward retail automation.

"No other industry with companies that large do as little as they do," Larson states. "They manage by eyesight or instinct. Some do very well that way. Some don't trust automation. They tried it years ago and got burned. The vendors sometimes promised things they didn't deliver."

Industry analysts agree that automating the

retail environment is more difficult than automating other industries. "The major difference in data processing in retailing than in other industries is the large number of small-value transactions," explains Robert Zimmerman, retail industry consultant for Coopers & Lybrand in New York.

"Instead of selling airplanes for \$1 million each, you are selling handkerchiefs for \$1 apiece. This creates enormous problems for retailers. They can capture the information, but once they've got it, how do they use it?"

That question is being asked industry-wide by chief executive officers. MIS managers credit the profusion of POS terminals to the stores as the catalyst for CBO involvement. As merchandising specialists, these industry leaders knew or cared little for the back room mysteries of the host system.

But when they saw the value of the POS on the selling floor—a place they felt comfortable at—and then saw the link from POS to that host computer and what the possibilities were in relation to the bottom line, interest soared.

At Zayre Corp. in Framingham, Mass., Michael Bloteti serves as senior vice-president and director of corporate information systems. Bloteti says the company, which owns more than 1,000 Zayre, T. J. Maxx and Hilt or Mine outlets, has long believed in the ability of systems to make it easier to serve the customer.

"The objective is simple," Bloteti says. "We want to make our stores a better place to shop. We want to help get the customers through the store, have the merchandise they want in stock and get them through the checkout as fast as possible. You have to stay a step ahead of everyone else, and with new and better systems, you can gain a strategic advantage."

Retail demands on MIS are growing

For MIS in retailing, the demands are increasing and spreading further away from the central headquarters. Though most large retailers retain a centralized host-based attitude, MIS is seeing demands on the rise from individual stores and outlets. Merchandisers, realizing the value of information on the spot, are no longer willing to

Large, small stores seek high-tech edge

Give or take \$280 million worth of systems responsibility, Charles Carlson and Art Freeman have strikingly similar missions in life. Both Carlson, vice-president of information systems and data processing for Sears, Roebuck and Co., and Freeman, controller of the Parkleigh Pharmacy in Rochester, N.Y., are using computers in a search for competitive advantage in the dog-eat-dog world of retailing.

While Sears, the 140 billion Chicago-based retailing giant, embraced technology in a big way more than 20 years ago, Freeman's Parkleigh store, a \$3 million specialty and gift shop, is a more recent convert to the wonders of computerization.

Freeman brought in his IBM system just four years ago. Nonetheless, both Carlson and Freeman are now settlers in their empires of information systems.

At Sears, Carlson oversees a nationwide network of systems for the Sears Merchandise Group. A 31-year Sears veteran—the last 20 in information systems—Carlson has watched the company's early commitment to computing grow to where he literally cannot name all the systems in place. It is estimated that the nation's largest retailer operates nearly 160 different systems—from point-of-sale (POS) to inventory management to distribution to front office automation—at a cost of more than \$500 million.

"There is hardly a portion of the business, either in the field or in the headquarters organization, that is not impacted to a degree by information systems," Carlson claims.

In Rochester, Freeman sees a similar dependency. Using a 5-year-old IBM System/38 Datastream, a little-known stand-alone desktop business computer, Freeman runs virtually every aspect of the store's business—from inventory control to general ledger to merchandise and sales analysis.

"I want this way in the first place because I was lazy, and the system saves me a lot of work," Freeman says. "But now I don't see any other way to run the operation. We really get store-related with paper work, and the system cut that down. It also eliminated the tedium of planning and buying."

For retailers of all sizes, from behemoths like Sears to one-store operations like Parkleigh, the use of computers has spawned a new level of awareness of business opportunities. From the basic back room accounting needs, information systems are now playing a significant role in the search for competitive advantage.

Carlson explains that Sears has never shied away from the potential of technology to build

Continued on page 44

Parkleigh's Freeman

Even if something inside it stops, it goes.

In the past, if you needed a fault-tolerant computer, you had to make certain sacrifices.

Namely speed and economy.

One fault-tolerant system tied up two processors to do one processor's job.

And the other depended on software that slowed everything down.

Well, NCR has invented a new system that changes that.

It's the NCR 9800.

Set up a 9800 for fault-tolerance and, if a module fails, the other modules take over for it while continuing to do their own work.

The 9800 keeps running during a processor failure, or a software failure.

It even keeps running during routine maintenance and upgrading.

What's more, critical files can be duplicated, so even if a disk fails, your files are available.

The NCR 9800 is built with field-proven 32-bit VLSI technology that has fewer components than conventional technology. So the chance of failure is very slim.

Because if something's not there, it can't break.

So if you need a computer that's hard to stop, you know where to go.

For more information, call 1-800-CALL-NCR.

Executive Report Retailing

Continued from page 42
the business.

In 1970, for example, Sears was the first major retailer to install electronic POS systems throughout its stores for data capture in inventory management.

The company, in fact, is already on its second-generation POS system. "We were the first major retailer to have full price lookup from the POS for both regular and promotional goods," Carlson adds. "And we've been communicating electronically with some of our major suppliers for nearly 20 years."

Carlson points out that Sears has more than 2,000 IBM Series 1 mini-computers serving as gateways to a nationwide distributed network that

reaches down to every store and outlet.

Via this sophisticated network, Sears handles inventory tracking and planning, and Carlson is stepping up efforts to improve Sears' just-in-time inventory approach in order to get merchandise into the stores faster.

99

For retailers of all sizes, the use of computers has spawned a new level of awareness of business opportunities. From the basic back room accounting needs, information systems are now playing a significant role in the search for competitive advantage.

More important, Carlson wants his systems to focus on the improvement of customer service.

"A major focus of everything we do in systems is to make sure we have a customer-service orientation — that we don't develop systems that impede our ability to serve the customer," he says.

Carlson describes a new catalog pickup system as an example. Using touch-screen terminals, Sears catalog customers can look up an item, order it, receive a ticket telling them where the order is, pick up the item and get checked out of the store in a minimal amount of time.

Though Carlson is proud of Sears' commitment to computers — "I believe we have the largest and most effective data gathering capability in retail" — he acknowledges that there is still much left to do.

"We can better utilize the information that we have to shorten lead times in getting goods to the stores and provide our merchants with more of what is selling and less of what isn't," Carlson reports.

That same type of information has made a dramatic impact on the Parkleigh store.

Freeman explains that the System/23, that was purchased along with all software and peripherals for less than \$30,000, has brought Parkleigh's buyer into closer touch with both merchandise movement and planning.

He further claims that this closer relationship has led to a 50% increase in stock turns since the system was installed (a stock turn is the number of times inventory is turned into sales).

"Our suppliers have gotten a good education from the system," Freeman states. "They can't argue with the numbers. The computer is unyielding and completely objective. They still try to blame the computer every once in a while, but soon realize who is wrong."

Freeman adds that the computer has freed up the store's buyer to spend more time on creative planning and less time on paperwork.

Though he says he would not qualify his software as an expert system, Freeman insists that, through trend analysis and sales analysis, the buyer can make better educated decisions on merchandise planning.

"Once you've got the historical data in the system, it can give you a sense of the trends and get you in the ballpark. When you're running 900 line items, the system is worth its weight in transistor chips," he says.

Freeman realizes that he is an anomaly among small retailers. Industry analysts point out that small to medium-size retailers have been slow to invest in technology.

"In general, the level of sophistication in retailers is lower than in any other business," says Jim Larson of Independent Retail Consultants in Evanston, Ill. "In the small range, retailers are very unsophisticated," he adds.

Freeman says he believes the key obstacle to technology in the small retail outlets is fear.

"I didn't know anything about computers, but I wasn't afraid of them either. A lot of retailers are simply afraid of computers. I had an innate desire to learn," he says.

"The system has given me confidence to see things clearly," he says. "It sort of puts us on the back. We'd not have gotten this far without the computer."

— GLENN RIFKIN

WYSE & SECURE

Whether you choose our T5151 Personal Computer, our T5151 Extended Technology Personal Computer, or our T5150 interactive terminal, you can be secure with PPL-listed PC compatible products from SGC. Executive Report Retailing

BY MICHAEL

Continued from page 44

wait for the corporate data center to turn around a requested application over a period of weeks.

At Zayre, Blotti oversees the corporate data center, but each of the company's five divisions retains its own data center and development staff. "The different operations have different systems needs," he says simply.

Blotti oversees all the individual operations and provides advice and expertise to each division on an as-needed basis. "I have an overview and expertise that they don't have," he points out. "I can generally negotiate better deals and coordinate corporate efforts."

But Blotti says he believes strongly that the decentralized approach is imperative for his company. "The divisions can better define their own needs," he says.

The centralized vs. decentralized question tends to get answered by the nature of the particular business. Large conglomerates with several different retailers in the fold tend to let the individual subsidiaries run their own technology show. In the case of a single chain, even one as large as Sears, centralized control remains imperative.

"The larger chains tend to have a central buying organization, and this generally means centralized control of information systems," says Stewart Neill, vice-president of MIS for Saks Fifth Avenue in New York. "MIS has to know what the stores need. There is definitely a mood toward greater centralization in retailing."

Even with central control, the downsizing of equipment is acting as a catalyst for the distribution of systems throughout retail organizations. Sears, for example, has more than 2,000 IBM Series/1 computers spread throughout its chain.

According to a recent IDC report on retail automation, retailers are looking to give better data to the individual store manager and to off-load data from the corporate mainframe.

"Corporatewide applications such as payroll and general ledger are still run on a large central mainframe, but many retail-specific applications like inventory management and price lookup are moving to smaller, in-store processors," the report reads.

Regardless of where control lies, the questions facing retailers tend to transcend questions of where

power is; they ask instead, What can the power do to help gain competitive advantage? Simply throwing more MIPS — or million instructions per second — into the operation can certainly help.

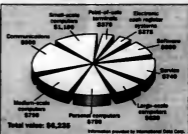

Zayre's Blotti, for example, has long used IBM's Inform software package — an information forecasting and replenishment tool — on his corporate mainframe. Inform, however, is "such a cruncher of MIPS" that Blotti could not effectively use the package until he took delivery of an IBM 3090 this year.

Retail MIS managers, however, are being pressed for more than just power. As in other industries, retailers are seeking ways to improve the bottom line through technology. The task is not simple; in many cases, it requires a complete change of atti-

tude on management's part on ways to do business.

And MIS, steeped in its own traditions, must make a concerted effort to get involved in store-front thinking. In addition, retailing is more at the mercy of general economic ebbs and flows than most other industries, and when times get tough, CEOs tend to pull in the reins on systems. This, MIS believes,

PLACE: WASHINGTON CONVENTION CENTER
WASHINGTON, D.C.

UNIX® Helps Your Computer Do More, So You Can Do More

Want maximum performance and operational support from your computer system? Need to optimize the capabilities of your equipment and your people?

Then you must seriously consider the advantages inherent in the UNIX operating system. Advantages that include: networking, multi-user and multi-tasking capabilities, software portability, distributed processing and expandability.

Learn all about the UNIX operating system by attending UniForum 1987, the International Conference of UNIX Users.

Don't miss the FREE UNIX introductory workshops. These sessions will give you valuable information on the basics of UNIX...its potential...and how to integrate it into your computer system.

Some 200 major vendors will display and demonstrate the full spectrum of UNIX operating system products and services at UniForum 1987...including hardware, software and services...for mainframe, mini and microcomputers.

A complete and comprehensive conference and tutorial program also will be presented during this important event. Call 800-323-5195 for all details.

NOTE: The USENIX 1987 Winter Conference will run concurrently with UniForum. The USENIX Conference will be held at Washington's Shoreham Hotel.

U.S. RETAIL AUTOMATION MARKET, 1984-1988

is a major concern.

"It's always a hard sell to management," Bilotti declares. "The economy controls the environment, and spending is definitely not growing by leaps and bounds. But in this business, if you don't continue to develop, you cease to exist."

Innovative shops, such as Zayre, are trying various cross-cultural projects to better blend MIS and the merchandisers. For the past nine years, Zayre has run a Business Systems Interface Group, a liaison organization linking MIS to the user organizations.

People from systems as well as end users have served in the group, translating users' needs to MIS and the capabilities of MIS to users.

'It's always a hard sell to management. The economy controls the environment, and spending is definitely not growing by leaps and bounds. But in this business, if you don't continue to develop, you cease to exist.'

— Michael Bilotti
Zayre Corp.

In addition, Zayre has an information center concept with a twist. Merchandising people come to the information center and are trained on personal computers and high-level languages.

For a period of time, those people then work as programmers within their divisions. Finally, armed with

expertise they could not have gotten elsewhere, they return to their merchandising jobs.

"The concepts have been very successful," Bilotti says. "They foster an understanding between MIS and the users."

Management Horizons' Kleinberger adds that additional relief

may be on the way for beleaguered MIS execs in the form of software productivity tools.

Aimed at allowing DP to deliver faster and better systems solutions, these tools include fourth-generation programming languages, relational data base management systems, end-user computing tools for ad hoc inquiry and reporting and off-the-shelf packaged software.

Large retailers with well-staffed MIS departments can offer these solutions, but the medium-size and small retailers must rely on their own instincts and expertise.

This creates a danger that Larson cautions can turn a retailer off completely to automation.

He suggests that retailers seek professional advice about which off-the-shelf packages to incorporate into their businesses.

In addition, Larson predicts that 90% of all custom-designed systems fail despite expensive investments made by retailers seeking specific answers.

"Retailers should go to consultants and to shows such as those the National Retail Merchants Association puts on," Larson urges. "There are lots of good packages out there."

Coming to grips with technology

As the emphasis in information systems shifts from routine support functions to advanced decision support applications, retailers are coming to grips with the difficulties inherent in trying to meld business savvy with technology.

According to Kleinberger, the use of technology in retailing faces a series of challenges as in 1980s approach. He makes the following points:

- The key users of technology and systems in the company are changing from middle management to senior management.

- As the key users move up the organization, the requirement for systems to be more flexible and responsive has become critical.

- With more opportunity for effective uses of technology now available, requests for systems development have significantly escalated, leading to a large backlog of unfilled requests at most companies.

- Further compounding the backlog problem is the huge investment in place in older technology and systems that traditionally have not permitted flexibility and generally restrict the ability of the MIS executive to respond to changes in the business needs.

- As a by-product of this problem, we are seeing DP personnel costs rising substantially as a percentage of total DP expenditures. Personnel costs now represent almost half of all DP expenditures.

Kleinberger also worries that a more serious problem lies ahead. He questions "the ability of the DP function to respond to the changing demands of the business."

MIS's ability to respond will ultimately depend on a mutual understanding between its own people and the merchandising specialists as to what is needed and what is reasonable to expect.

Some sophisticated tracking systems, for example, have already

Q—"How do I plan for new technologies and implement them into my company?"

A—"To help solve this problem CN '87 offers a full range of tutorials, seminars and discussions with most of the leading industry representatives who will discuss workable solutions to the pervasive implementation dilemma. To meet this need, there are a number of tutorials and seminars that deal with both tactical and strategic planning as well as user case studies that reveal the best approaches to implementing the new technologies."

Gerald P. Ryan, President
Connections
Telecommunications Inc.

Ride the wave

at the 9th Annual
COMMUNICATION NETWORKS '87
Conference & Exposition
Washington Convention Center
Washington, D.C.
February 9-12

Four days that will dramatically
impact the way you do business

Over 1,000 must-see exhibits, 300-plus vendors and more than 17,000 of your friends and colleagues expected to attend makes CN '87 the communications event of the coming year!

CN '87 is four days of discovery—displays of voice, data and telecommunications equipment, services and software—the newest innovations and leading-edge technologies developed in our fast-changing industry. For 1987, CN delivers everything that has made it the elite expo and more—many more new product introductions and three huge halls full of exhibits in the bright, beautiful Washington Convention Center.

Plus CN '87 offers you a series of "in-depth" tutorials and a conference program unlike any other providing you with hard facts, how-tos, product solutions and important perspectives on such vital issues as regulation. At CN '87—under one roof—you attend the expo and learn in depth from industry experts about topics that directly influence your career, your organization ... your present and your future.

Who should attend

If your title or job function appears here, be sure you attend the premiere telecommunications show—

- Top management with goal of improving telecommunications, network capabilities
- Corporate Communications, Telecommunications, Networks Manager, Director
- Communications Planning Manager
- Communications Systems Manager, Designer
- Communications Analyst, Specialist, Programmer
- Communications Coordinator, Operator, Technician
- DB/Software Manager, Analyst, Programmer
- Systems Engineer, System Engineering Manager
- Office Systems Manager, Analyst
- Product Development, Business Planning Manager
- Scientist, Engineer, Engineering Manager
- Operations, Maintenance, Installation Supervisor, Manager
- Sales, Marketing Executive, Manager

You, Yes, You

will return to your organization with more invaluable information from CN '87 than from any other single source

Three spacious exhibit halls—over 378,000 square feet—filled with voice, data and telecommunications equipment, services and software products await your arrival at Communication Networks '87.

You will learn how vendors have addressed major areas in telecommunications. From network management, long-distance carrier services, fiber optics, teleconferencing, to micro-to-mainframe connection, CN '87 will show you how to improve productivity, performance and the bottom line!

Test, Evaluate, Compare— Solve Telecom Problems

Bring your shopping list, your wish list, your problems. You'll go home with solutions, ideas, hard facts. As the premier telecommunications show, CN '87 offers you the best representation of the leading, most innovative vendors. Come to CN '87 prepared to discuss your specific needs, to get answers to your most difficult questions, to solve your most complex problems.

CN '87 Gives You the First Look At New Products And Breakthrough Technologies

Because CN is known throughout the industry as the prestigious show, vendors launch more new products here and demonstrate more leading-edge technologies. Nowhere else under one roof will you have direct access to what's new in all areas of telecommunications.

Meet Your Peers, Your Best Prospects

Movers and shakers... decision-makers... industry innovators... you'll meet them all at the expo, have a chance to chat in tutorials and conference sessions. Every year, CN draws a bigger, better crowd. Attendance is expected to top 17,000, well over 1986's 15,000. As our industry grows in size and importance, CN is increasingly recognized as the place to be!

CN '87 Is Expo PLUS "In-depth" Tutorials And Comprehensive Conference Program

From February 9-12, the Washington Convention Center is your telecommunications university. You'll discuss and learn about important issues and significant new technologies and find out their impact on your organization. CN's "In-depth" tutorials for CEU credit, the keynote speakers who are major forces in the industry and its prestigious conference program are designed to keep you at the forefront in knowledge of our industry.

Learn Latest About VSAT, Token-Rings, Strategic Planning—And More

Select an "In-depth" tutorial from the series that takes place on Monday, February 9. You'll get Continuing Education Units credit and certificate in recognition of your attendance. Do you need to closely monitor the regulation scene? Or specific technical data? Are you a Senior Manager who needs to understand the impact of telecom developments? Choose from over 65 conference offerings during the show, Tuesday through Thursday, according to your particular needs and areas of responsibility.

Washington, D.C. Is Where It's At

Sately monuments... hallowed halls, glorious treasures and artwork of past and present... for sightseeing, shopping, fine dining and more. Our nation's capital makes the perfect site for CN '87. See last page for hotel and travel information and how to SAVE on both.

More Attendee Services

Thoughtful planning at every step makes best use of your valuable time. You're here to do business, we've made that as pleasant, easy as possible. The full-service message center in main lobby handles incoming calls, helps you stay in touch with your office. Also in the lobby is help with taxis and the Metro® the capital's rapid transit system, hotel shuttle buses and airport transportation. The spacious luncheon area seats over 2,200 so waiting is minimized and you don't waste time.

Communication Networks

Through the changing tides...

Communication Networks (CN) Conference and Exposition, founded in 1979, is an educational and industry event that has sponsored the introduction of new communications technologies such as satellite business networks, fiber optics, LANs, and specialized common carriers.

CN is based on a connection and concept put forth by Richard E. Wiley when he was in private communications law practice after a term as Chairman of the FCC. Wiley envisioned the technical and applications unity of voice and data networks and the scope of market opportunities available under deregulation.

Since the first show in 1979, CN has grown in size and scope and increased its number of exhibitors and attendees almost 20 times. For the rich diversity of products and services on exhibit and for its outstanding programs developed to address the most significant issues in telecommunications today, CN deserves its standing as the premiere show in our industry.

Monday, February 9, 1987
Register now to guarantee enrollment
Call TOLL-FREE 1-800-225-4698**

In every way, Communication Networks '87 is a time of discovery.

And you can give your career—and your company—a significant boost by attending a CN '87 intensive "In-depth" tutorial on Monday, February 9, one day prior to the opening of the show floor.

Take advantage of this opportunity—it only comes once a year—and take part in the most comprehensive one-day learning experience in the industry. Each tutorial puts you face-to-face with a top telecom professional, selected by CN as the industry's leading expert on a given topic.

You'll be invited to ask questions pertinent to your organization in each tutorial. You'll

benefit from colleagues as they share their experiences in solving problems similar to yours and you'll learn much about how to relate trends and products to your organizational needs.

For All Telecom Professionals—Technical, Non-Technical, Introductory to Advanced

Attend the tutorial that addresses topics most important to you. You'll qualify for Continuing Education Units and certificate. Please note tutorials are rated as introductory, intermediate and advanced so you're sure of reaping maximum benefit from the tutorial you select.

"In-depth" tutorials on key data/voice/telecom topics

**Date: Monday, February 9, 1987
Time: 9:30 am–5:30 pm
Place: COMMUNICATION NETWORKS '87
Washington Convention Center, Washington, D.C.**

Check ☐ tutorial listings below and select one you'll profit from most:

- ☐ **T-1 Open Systems Integration (OSI)—A Technical and Strategic Review**
Leader: Harold C. Felts, Executive Director, OMNICOM Inc.

Gain a thorough understanding of concepts and terminology of OSI, a working knowledge of OSI architecture, an introduction to the 7 layers of OSI protocols, and expert guidance in applying OSI to the evolution of distributed information systems. Examine all practical realities facing corporations as they

move into OSI implementations.
Level: Intermediate

- ☐ **T-2 ISDN—Status and Developments**
Leaders: James G. Herman, Director and Mary A. Johnston, Senior Consultant, Telecommunications Consulting Group, BBN Communications

Learn exactly what ISDN will and won't deliver in the late 1980s, what emerging ISDN standards will mean for new services and improved network performance, what holes still exist in the standards and trials, how to make smart buying decisions while keeping your options for ISDN compatibility and more.
Level: Intermediate

□ T-3 Strategic Planning for Corporate Information Networks

Leader: Dr. Howard Frank, Consultant, Howard Frank Associates

This tutorial will help you in making key decisions affecting every area, even the very core of your organization. Learn how to relate vendor offerings and technological trends to your organization's needs and requirements and how to develop a framework to plan future services, systems. Examine current issues in network integration, why communications departments must function as "mini telcos," the pros and cons of software-defined networks and private dedicated networks.

Level: Introductory-Intermediate

□ T-4 Planning and Designing Networks with the New Technology

Leader: Dr. John M. McQuillan, President, McQuillan Consulting

In this intensive seminar you get acquainted with key architectural principles used by today's leading network planners and understand their application in several case studies. Review emerging technologies, T-1 networks, hybrids, VSATs, gateways between SNA, LANs and X.25, micro-to-mainframe links, intercompany networks and more.

Level: Advanced

□ T-5 Building the Network Management and Technical Control Facility

Leader: Gabriel Kasperick, President, Kazoom Inc.

Understand the strategic value of network control, explore alternative technologies for managing your network and find out how to evaluate current technologies for use in your own organization. You'll also learn about test equipment you need for successful network control as well as industry trends and directions for the future.

□ T-6 Designing Voice and Data Networks under the New Tariffs

Leader: Robert L. Ellis, President, The ARIES Group Inc.

Prepare to maximize opportunities, minimize pitfalls of post-divestiture tariffs. Take this tutorial to learn the structure of new tariffs, the latest January '87 changes to these tariffs, how to price interstate private lines, how to configure and price interstate FX services, the new economics involved in configuring data networks, the LATA-pure strategy—and more.

Level: Intermediate

□ T-7 Managing the Telecommunications Resource

Leader: Gerald P. Ryan, President and Founder, Connections Telecommunications Inc.

How to develop a successful management environment, what tools to use to do your job more professionally, how to plan a network management center, how to staff and train the department, how to prepare and substantiate departmental budgets are topics covered in this highly intensive session.

Level: Intermediate

□ T-8 IBM Token-Ring Versus Other LAN Choices

Leader: Dr. Kenneth J. Thurber, President, Architecture Technology Corp.

For the benefits—and headaches—of IBM's controversial Token-Ring technology, this tutorial gives you a total overview of announced products, future plans, compatible products and IBM's overall strategy. You'll discuss Token-Ring's relationship to IEEE 802.5 and get an in-depth look at NETBIOS and APPC/LU 6.2 interfaces, and more.

Level: Intermediate

□ T-9 VSAT Technology and Implementation

Leader: Dr. Jerome G. Lucas, President, TeleStrategies Inc.

Learn the basics of applying very small aperture terminal (VSAT) satellite communications to your networking needs. You'll learn about basic application requirements in SNA networking, data broadcasting, PC networking, video broadcasting and teleconferencing. An overview of service offerings and vendors is provided.

Level: Intermediate

□ T-10 IBM's Systems Network Architecture (SNA): A Detailed Road Map

Leader: Daniel Zatyka, President, Zatyka Associates

Enroll in this intensive one-day tutorial to understand the evolution of SNA and learn fundamental SNA concepts, the 7 SNA architectural layers, SNA's physical and logical addressing strategies, SNA products, components of NetView, Token-Ring networks, functionality and capabilities of the LU 6.2/APPC and NETBIOS interfaces and more.

Level: Intermediate

□ T-11 An Introduction to Data Communications Today

Leader: Gary Audin, President, Delphi Inc.

Gain a comprehensive and practical understanding of data communications in this course. Learn about basic concepts, terminology and technology and how various networks operate and how to select them; how best to interconnect computers, terminals and PCs using different protocols; and what software is necessary to support protocols and network management.

Level: Introductory

□ T-12 Understanding the Communications Regulatory Environment

Leader: Richard E. Wiley, Senior Partner, Wiley, Rein & Fielding

This tutorial leads you through the maze of regulatory bodies here and abroad. Learn how telecommunications policy is made and changed, what agencies are active in policy-making, how industry segments are affected by current policies, what key issues are now under consideration and how you can influence future decisions.

Level: Introductory

Town Meeting

Modified Final Judgement—Anti-trust Settlement Impact on the Telecommunications Industry After Five Years

Since divestiture, the telecommunications industry, regulatory agencies, Congress and Judge Greene's court have been adapting to the brave new world of telecom. This year's Town Meeting—always a popular session—will reflect on the Modified Final Judgement. Join Richard Wiley, Conference General Chairman, and participate in a lively debate with these major players.

Robert Allen, President and COO, AT&T

Samuel Gann, Vice Chairman of the Board, President and CEO, Pacific Corp.

Albert Halperin, Chief, Common Carrier Bureau, FCC

Peter Hubert, Consultant, Dept. of Justice

William McGowan, Chairman and CEO, MCI Telecommunications Corp.

Richard Wiley, Senior Partner, Wiley, Rein & Fielding

Conference Program

CN's growth and experience guarantees you a conference program committed to vital issues you face today

Early Bird Basic Sessions

7:30-8:20 am

A series of solid, basic presentations starting from square 1 and explaining ATCAs (All Those Confusing Acronyms). The Early Bird series is by request, based on feedback from '86 attendees. Designed for people new to telecommunications or experienced professionals with expanded responsibilities in new areas.

As you know, no one can say truthfully that it's easy to keep abreast of the fast-moving world of telecommunications. Yet rapid change, technological breakthroughs, issues surrounding deregulation, and many other factors make accurate, up-to-the-minute knowledge absolutely essential.

Yes, You May Have to Roll Up Your Sleeves—(but then, knowledge is POWER!)

What CN's experience and clout can do for you is provide an exchange of latest data and forum for discussion with the most-respected, top authorities in telecommunications in a conference program that may well be the high point of your year. The sessions you attend are substantive presentations, not sales pitches. Many topics are by request from previous attendees and/or the result of CN's extensive review and evaluation procedures of past programs.

Don't Re-Invent the Wheel

Take advantage of CN's conference program consisting of more than 65 intensive 90-minute sessions, presentations and discussions. Organized along eight tracks, each session deals extensively with a specific area of interest. Learn from technical wizards, legal eagles and experts who've already checked out the latest products and technologies.

Program Tracks

The eight tracks of conference sessions cover a comprehensive range of topics. The track titles provide an indication of the breadth of topics to be presented at Communication Networks '87.

Strategic Business Perspectives

Take this track to sharpen managerial decisions. It will cover the major shifts in the telecommunications industry and their business implications. Also covers breakthrough technologies, significant market realignment and the new networking environment.

Washington Scene

Select this track and be prepared for shifts in regulatory practice. Unique to CN, this track covers how regulation, deregulation and re-regulation are likely to affect telecommunications users and vendors in 1987 and beyond.

Technology Briefing

In a technical area and need leading-edge data? These sessions offer a detailed look at

specific technologies by leading research contributors. Presentations assume attendees have a high level of technical knowledge. Not for beginners.

User Case Studies

Profit from others' triumphs, their traumas. Take advantage of your peers' experiences in addressing specific business needs with telecommunications technologies. These sessions deal with both technical issues and economic justification.

Industry Issues: Pro & Con

Controversy can pay off—and is very much part of our fast-paced industry. Here are opposing viewpoints presented by intellectual antagonists, emphasizing questions of real implementation payoffs for users, market potential for vendors and the public interest.

Voice Networking Issues

Are you reaping the maximum savings, getting the most in services? A track devoted to the part of your network that still accounts for a high percentage of your telecommunications costs. The focus of these sessions will be on both cost savings and the opportunities for providing innovative voice services.

New Products

Understand specifically what new products offer your organization. This is your opportunity to review, in an efficient, time-effective process, the specific types of new products that you came to CN '87 to see. These sessions serve as an excellent guide and help you get the most out of the exhibits.

How To

If you're practical, results-oriented, select this series of specific "solution" sessions. At the end of these sessions, you will have the knowledge that you need to deal with specific technical and management problems.

Which wave to ride?

Can't decide which program track to choose because each one would be of tremendous value to your organization?

Just bring a colleague—or 2 or 3—to CN '87. You take one track, they take another, then pool your knowledge and information... Call for more information on team discounts. 1-800-225-4698.

13 reasons you should attend CN '87

1. **Sharpen your mastery of voice/data communications.** Through classroom instruction, face-to-face meetings with seminar leaders, exchanging ideas with your peers, your CN '87 tutorial gives you the knowledge that would ordinarily take years to acquire on your own.

2. **Discover product solutions to your current and future needs.** Get the latest on network management, long-distance carrier service, fiber optics, SNA and other products and services designed to improve your data and voice communications capabilities.

3. **Get advice on how to handle multi-carrier/multi-vendor planning, operations, control and buying decisions.** Develop a strategic framework for planning, implementation. Know trends, implications of new technologies including network integration. Review process of planning a corporate network from requirements analysis through the final acceptance test.

4. **Improve your network management skills.** Create a successful management environment in which procedures, hardware and software all maximize up-time.

5. **Overcome problems** associated with rapid network growth. Bridge the gap between proliferating high-tech capabilities and your existing equipment, expertise. Anticipate upgrading, expansion issues.

6. **Control costs.** Define your networking hardware and software needs more accurately. Master cost-saving network control management and operations procedures.

7. **Benefit from others' experiences.** Avoid mistakes by learning from your colleagues who will share triumphs and triumphs of implementing new systems.

8. **Turn change into opportunity.** Understand the strategic and tactical impact of today's latest developments. Know what's coming in months, years ahead.

9. **See what today's leaders are doing.** Find out about present and near-future concepts from the leading edge in communications. From OSI to ISDN, VSAT to T-1 networks and X.25, you can find out about implementation trials and early applications.

10. **Know the new generation of technical standards arriving at a rapid pace.** Choose a tutorial that gives you the latest on OSI, ISDN, Token-Ring technology or SNA.

11. **Keep abreast of IBM's products and de facto standards contributions.** Understand IBM network architecture, Token-Ring technology and alternatives to it.

12. **Learn results of early implementation trials and important case studies.** Find out how ISDN implementation trials are progressing at the BNCs and LAN, PBX and long-distance companies. Review use of T-1 switches, VSATs, optical fiber and other new technologies, as well as on network design under the new tariffs.

13. **Understand the regulatory maze** and the development of telecommunications policy as well as the decision makers involved. Examine today's major issues and prepare for new entrepreneurial opportunities.

**No-hassle hotel reservations with savings—
Call TOLL-FREE 1-800-553-0505
In Massachusetts 1-617-965-1000**

You're assured of hotel accommodations to meet your requirements at CN '87. Simply call Royal America and choose from our list of Washington, D.C.'s 15 most popular hotels. You'll save, but space is limited so reserve now for best rates and locations.

Need a hospitality suite? Cocktail reception? Simply call Royal for assistance and the assurance that your rates will be less than the lowest available corporate rates.

Save up to 45% on airfare to CN '87, to reserve call TOLL-FREE 1-800-433-1790. Ask for STAR file #S-11616

American Airlines offers special Meeting Saver Fare™ to all participants of Communication Networks '87. You can travel anytime between February 6 and February 14, 1987 and save up to 45% off regular coach fare.

"In a time of turbulence and change, it is more true than ever that knowledge is power."

John F. Kennedy

Interview

After a slow start, retail gets on-line

John Chay has been involved with computer systems in the retail world since 1955. He has worked for such retailers as Abraham & Straus in New York, Thalheimer Brothers, Inc. in Richmond, Va., L. S. Ayres & Co. in Indianapolis and The Broadway in Los Angeles. He joined the National Retail Merchants Association in 1979 as vice president of the information systems division. He spoke recently with Senior Editor Glenn Rifkin.

Has the growth of computers in retailing been slow and steady or just very intense recently?

It's gone in plateaus and surges. As the retailers had money from the economy exploding, it might surge upward. When the recessions came along, the austerity programs went into effect. There was little development work going on as a general rule. The climb has been steady. The biggest single thing that has affected the growth has been the microcomputer. In retailing, like other industries, 50% of the business is done by 20% of the companies. So all of a sudden, with the appearance of the microcomputer, that 80% of smaller guys got a shot to do some of the things some of the big guys have been doing.

For the bigger retailers, what would be the key change in the last five years in terms of computerization?

They discovered that the enormous amount of historical information they have been building for years within their files, on sales and operational aspects of their business, was an invaluable resource. Now they are beginning to try to find ways to access that as a very positive tool in their management decision making and planning.

They say, "This is being done in some of the other industries, why shouldn't we be doing it in our own company?" The whole concept of artificial intelligence, or expert systems, or strategic planning based on volume, is now synthesizing or washing down millions and millions of bits of information into practical and useful tools to direct the business.

What is MIS's role in retailing?

Traditionally, the retail organizations have had big computer shops and centralized control. Again, retailing is hard to talk about generically because you have different kinds of entities within the retailing industry. But as a general rule, the concentration was in big computers in one location or regional locations and the control being conducted from headquarters.

End-user computing in retailing has been very slow to catch on because the technology has followed the design and buying process of the merchandising divisions that are the guts of the retail business. When buying had been concentrated in one location or regional locations, the power was there. So the stores were

given a book, "Here's how to run the store, now run the store," and headquarters decided what merchandise to send them.

Little by little, more decision making has been delegated to the stores, and that's another trend in retailing: Providing some of that informational magic and knowledge to the stores as opposed to just collecting information out of stores, into a headquarters computer and running things from headquarters.

Compared with the use of computing at large corporations such as

dialing expertise to provide the best assortments. The next part is monitoring sales to see where adjustments are necessary: necessary, mark-downs, transfer of goods between stores and that kind of thing. Where there has been little work done is in that planning process, which is dependent on prior years' results. That's where you become dependent on a buyer's intuition or technique to select the right merchandise.

But that's still a very human decision, not one a computer can make unless you've got an expert system

field, Zayre and Carter Hawley Hale have done some interesting and beneficial work.

What about the large vendors? How are they responding to the retail area?

IBM has done a lot of software development in this area over the years. It has always offered retail software packages and now endorses others as well. The retail market for that, I believe, is mid-scale and down.

So the large users are writing their own software?

Yes. Those folks are going to insist on doing the software development themselves because they know what they want. A chain of 30 stores doing a \$100 million a year, if they don't have a computer, can go out and buy stuff off the shelf that can work very well for them. They just have to make a few minor adjustments.

Are you seeing more of a decentralized or constrained environment emerge in retailing?

There again, different corporate structures have emerged. Every thing from "Corporate gives you the book and this is how you do it," to "Corporate says, 'We don't think you ought to buy that.' Most of the places have accomplished some degree of centralization and allow for some local autonomy that makes a lot of sense.

Almost every division of the large department store groups has a relatively high degree of autonomy. Bullocks, Abraham & Straus and Filene's being members of Federated Department Stores, Inc., still have a large degree of autonomy. Jordan Marsh in Boston and Jordan Marsh in Miami are two different worlds computer-wise, although there is a high degree of control from headquarters.

If they're all got similar systems, what is going to give one retailer a strategic advantage over another?

There are several factors. The first is selecting the data that they choose to embed in their strategic systems; identifying those truly useful pieces of information that will influence their planning and measurement effectiveness. The second is the ability to choose outside data to blend with their internal data and how they interpret that and blend history with today's information and analyze it.

One of the key things is going to be the extent of the experience of the king of MIS in that particular company — how much he's been able to absorb in terms of what's important in the management of the company and that merchandising process and how much the top two or three people in the enterprise have become aware of the opportunities of technology. Those two factors are probably the key in the overall design and development of these expert systems. ■

In retailing, 80% of the business is done by 20% of the companies. With the appearance of the micro, the smaller guys got to do the things the big guys have been doing.

General Motors Corp. or American Airlines, where is computing in the retail arena — still years behind?

If you compare retailing to the airlines, the brokerage business or banking, those folks are ahead of many retailers in the exotic and advanced applications techniques. How big that gap is, is hard to speculate. I don't imagine it's more than two or three years.

In merchandising planning the key application computers address?

That's the guts of the retailing business.

Beyond expert system or AI programs, how do you use computers in this merchandising planning area?

That's tough, because first you have to recognize that within merchandising, there are distinct requirements for distinct kinds of merchandise. Big-dicket items, such as furniture, carpeting, major appliances, are controlled on the basis of a serial number. The next level in high-fashion, expensive apparel that is controlled on a size and color basis: women's coats, men's suits, shoes. You have to control those at what are called SKU, or store keeping unit, levels.

Then you get the very inexpensive things like pencils and pens, which you control by classification. You want to make sure that in your stationery department you have enough based sets of this price line. Each of those levels, or types of merchandise, is treated differently within the stores depending on how the store approaches its overall merchandise plan. Generally, some kind of dollar controls are established on high, and then you use the merchan-

dant's known to work — and I haven't heard of any in the retailing area.

It can establish trends in price lines that tell you, "This looks like the hot price line coming up this year based on what's happened over the last five or eight years." It can tell you that you need, in a particular classification, 35 dresses in this price line and 20 in this price line. It can provide a lot of that kind of information that the buyer can't assimilate in his head.

Does that provide any off-the-shelf packages from being of much help in retailing where each company has such specific needs?

Absolutely. Some companies have expertise internally, particularly on the users side, and they've also got the expertise on the technical side. Places like Zayre Corp. have learned to marry those two capabilities to optimize the end result. Any software company would have to pay a fortune to get that kind of knowledge together under its own roof.

So how are they working together? Are people at Zayre calling IBM and saying . . . ?

No, I mean internally. The computer people and the merchants at Zayre have built bridges over the years. They have taken people out of MIS and put them in merchandising. That seeding has blended the organization to work together toward that common goal.

You're seeing that trend in big retailers?

Absolutely. In that particular

Retail cashes in on PCs

By PETER COHEN

Getting the right merchandise at the right price to the right place at the right time; this is the key to success in retailing. To assist in this monumental task, America's largest stores have long used sophisticated computer systems. J. C. Penney Co., for example, has an annual data processing budget of several million dollars and uses nearly 50 mainframes and more than 45,000 point-of-sale (POS) terminals to manage inventory, track customers, order merchandise and perform other critical retail functions.

Similar problems confront small stores as well, but until recently they relied on manual systems. Before the introduction of personal computers, limited budgets precluded the smaller retailers from purchasing and using computers. Affordable PC-based systems now give these small retailers benefits similar to those enjoyed by the largest stores in the industry.

While the large chain stores are ubiquitous, most of the two million stores in the U.S. are small operations employing fewer than 10 people. These businesses will buy many of the PCs sold to the retail industry. Shipments to small stores will account for a large portion of the projected 22% annual PC sales growth from 125,000 units in 1986 to more than 300,000 units by 1988.

The True Value Hardware store in Columbia, Tenn., owned by Bill Patterson, has installed a PC-based system to automatically track about 10,000 items in inventory. The system functions on Pro/Hardware software, an application package developed specifically for hardware stores by Automated Systems Design, Inc. in Nashville.

The package runs on an AT&T 6300 Personal Computer equipped with a cash drawer and a dot matrix printer. The system is used as a POS terminal in place of a cash register and for managing inventory, purchase orders, customer mailing lists and invoices. The single POS system and a second 6300 PC with a hard

disk for office applications have allowed Patterson's business to expand without excess inventory and a full-time bookkeeping staff.

Equipping the PC with a cash drawer offers several advantages to the small retailer. The unit is multifunctional. It operates as a cash register during business hours. After closing, the PC is available for inventory management, accounting or any other application the owner cares to run. This configuration eliminates the need for a separate POS terminal or electronic cash register.

The PC can also make more information available to the operator at the point of sale than is available through a cash register. The sales agent can be apprised of the customer's credit standing, mailing address or recent purchases with a PC-based

POS system.

Application software developed especially for retailers, like Pro/Hardware, is becoming increasingly available. Such packages are indispensable for small stores with no in-house programming expertise. About 500 retail-specific packages are on the market. Though this offers retailers a wide choice in price and functionality, they should carefully assess a package's track record and its vendor's capability to support it.

PCs have also opened a market in medium-size retail chains. The flexibility and cost advantages of micros make them particularly attractive to rapidly growing specialty stores. David Victorino, controller of ACA Joe stores, made the decision to replace electronic cash registers with a PC-based system, citing "the flexibility

it gives in growing the system."

ACA Joe, a merchandiser of men's casual wear, has grown from five stores in mid-1985 to nearly 100 today and plans to have another 100 stores across the U.S. by the end of 1987. When the transition from electronic cash registers to PCs is completed, each 1,200-square-foot store will have a single IBM Personal Computer XT with a cash drawer and a dot matrix printer.

Each ACA Joe store's PC is equipped with a modem and transmits sales and inventory data overnight to an IBM System/38 at the firm's headquarters in San Francisco. In this fast-growing chain, moving inventory quickly from one location to another is critical to success.

The MIS staff preconfigures each system, installing the software and

AT&T IS IN TOUCH HERE AND

require high-performance transmission. It's a high-quality, high-capacity private line that uses satellites to transmit virtually any kind of information.

AT&T International ACCUNET® Packet Service, which provides you with a reasonable cost high performance packet switching interface for international data transport.

And AT&T International Private Line Service, which answers your need for a rapid flow of both voice communications and data transmissions. It offers a more efficient, direct link between your company headquarters and its branches.

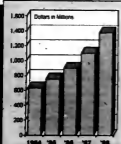

Of course, AT&T understands that all your communications needs must be met quickly and efficiently. So just as AT&T works together with foreign telephone companies to

No matter what industry you're in, AT&T recognizes your need to conduct business all over the world. So AT&T can provide you with international telecommunications services that give you most of the benefits you enjoy domestically, overseas.

Services like AT&T International DATAPHONE® Digital Service, designed to streamline data transfer and order/entry processing.

AT&T International SKYNET® Digital Service, developed for companies that

SHIPMENTS OF PCs TO U.S. RETAIL INDUSTRY

Executive Report Retailing

assembling a starter kit with an installation checklist, printer forms and user manuals before shipping the system to individual stores. The fine-tuned installation procedure takes a store owner a matter of hours. The MIS staff has found that training sales help on the system is easier and takes less time than training on an electronic cash register.

As an alternative to dealing directly with the hardware and software vendor, as ACA Joe has done, retailers can purchase turnkey systems from value-added resellers (VAR) or value-added dealers. More than 100 VARs and value-added dealers maintain expertise in micro-based systems for retailers.

These firms may provide hardware, application and communications software, installation, training,

support and service. Their expertise is particularly valuable in complex installations with existing POS terminals, electronic cash registers and PCs distributed across multiple stores and a central minicomputer controller.

While ACA Joe has opted to replace its electronic cash registers with PC XTs, retailers may choose to add personal computers without rendering their existing systems obsolete. Leading POS and electronic cash register vendors now offer a means to integrate PCs. NCR, for example, offers the 2114/PC Retail Management System. Up to 32 in-store electronic cash registers and unlimited remote locations can be linked to an NCR PC running inventory management software.

By no means are large stores

closed out of microcomputer applications. PCs have found their way into nationwide department stores amid sophisticated mainframe-based systems with extended networks of POS terminals. Attempting to effectively integrate PCs into these complex systems, however, has delayed a rapid and widespread adoption of personal computers in large stores.

The most successful installations to date have used PCs for unique strategic applications designed specifically to boost market share and revenue. Mainframe and mini systems handle the traditional efficiency applications, such as inventory management and accounting.

Cohen is a senior consultant with International Data Corporation.

Continued from page 48

demonstrated the ability to significantly lower inventories, a boon to the cost-conscious retail mindset.

Undoubtedly, more is needed.

The basic tenets of retailing are simple: buy, sell, replenish. But within that cycle are countless questions that can, if they are answered correctly, make a huge difference in revenue.

Merchandise planning. For example, has come to the fore as area in which computers can provide a significant edge if utilized properly. According to Coopers & Lybrand's Zimmerman, the melding of merchandise and financial planning is being done with success in some cases.

"It is the most difficult to do but has the most payback," Zimmerman says.

Gaining the strategic advantage

"You can gain a strategic advantage by knowing what items are moving well and what are not and what goods you have where in a timely fashion," Neill says. "The more accurate the information, the more accurate decisions can be made."

According to Neill, virtually all large retailers are computerized now, so the advantage will come from specific implementations within each business.

"There are people who do a much better job than others. They just have tighter control over inventory, buying and distribution," he explains. Inventory control is crucial to success in retailing, and both medium and large retailers are seeking ways to gain an advantage in this. Inventory accounts for a high proportion of a retail store's assets, and the low margins found in retail require high sales volume and rapid inventory turnover.

Consultant Larson points out that inventory control is an essential element of success for small and medium-size retailers.

"With all those transactions, you need a lot of control," he says. "I've seen successful systems lower inventory by one-third by helping to broaden the selection and improve sales."

Distribution issues, especially in huge chain-store operations, are also critical. Zimmerman points out that the more stores in a chain, the more important the decisions as to where to put the merchandise.

"It's a simple idea," he explains. "Can I get the right merchandise to the right place at the right time?"

In that vein, innovative retail MIS shops are looking at creating data bases that track an item from its lowest common factor, the stock keeping unit, and follow that item from its creation to the shopping bag, with an eye on each discrete activity along the chain, such as loading, handling and drop-ship.

"The idea is to find the most efficient way to deal with that product," Zimmerman says. "You couldn't do it without computers. It will eventually change the way people work in this area."

Although there is a long way to go

ENGINEERING

So the MIS executive asked,
“How do I get departmental systems
that keep everyone happy?
Including me.”

And we said, "That's our department."

With Honeywell's ONE (Office Network Exchange) PLUS Departmental Systems, computer pros and department heads together can make fully integrated departmental computing a reality. And at the same time protect their present investment in WANG and IBM systems — by tying them together through ONE PLUS's communications capabilities. ONE PLUS also supports IBM's SNA, Honeywell's ISO-based DSA, Ethernet, MAP and TOP protocols. DMI interfaces to AT&T PBX's.

Much more than communications, ONE PLUS provides business applications like office and data processing, Transaction Processing, Business Graphics, Electronic Mail, Document Translation. Plus access to islands of computing through data

base tools such as ORACLE** and ONEbase.

Through ONE PLUS's unique document translator, all your systems can share information in their native format: Users can create, revise and transfer files among IBM and compatible PC's using Multimate, Wordstar and Displaywrite; WANG OIS and VS systems; and Honeywell.

The heart of ONE PLUS is Honeywell's new DPS 6 PLUS family of 32-bit virtual memory superminis. With shadow processing and tightly coupled multiprocessor architecture, these systems are more than a match for IBM's System 36, WANG's VS, Data General's Eclipse MV, and Digital's VAX.

For more information, call 1-800-328-5111, ext. 9712 or write Honeywell Information Systems, MS440, 200 Smith Street, Waltham, MA 02154.

Together, we can find the answers.

Executive Report Retailing

Continued from page 53

go, leading-edge retailers are also working in the area of expert systems, hoping to find methods for turning a buyer's genius into a software program. With artificial intelligence introduced to future retail systems, merchandisers could receive suggested courses of action that would optimize the selling cycle.

"It could change things dramatically," Neill says. He is hopeful that buyers can use systems to address such continuous setbacks as having the proper-size items in stock. "No retailer seems to get the size mix correct," Neill explains. "There are always lots of smalls and extra-larges but never enough mediums. Computers could certainly provide statistical analysis that would help in that. It seems obvious, but it is not as simple as it sounds."

"And besides, you won't ever get rid of overruns."

With fashion merchandise, there are model changes, seasonal changes and differing tastes. And if you reduce inventories too close, you won't have the item in stock. You can fine-tune the problem, but you can't eliminate it," Neill adds.

Jack Brill, a retail industry consultant for IBM, adds that computers will soon find their way into another untapped arena — computer-assisted design of stores. Retail outlets, he points out, are constantly redesigning store layout, shelf area and displays.

Department stores, for example, are constantly tearing down walls and rebuilding to create new looks for their merchandise.

Systems can be used to help maximize the redesigned space to get optimum use of allotted areas. Wal-Mart Stores has already begun doing this type of design on an IBM 4300, according to Brill.

Boxes and boxes

Retailing has embraced a myriad of technologies, especially in larger companies. Virtually every retailer in the \$50 million range and up is mainframe based, with IBM holding 85% of that market.

What is emerging, according to IDC, is a market for cost-effective in-store processing on minicomputers, supermicros and personal computers. Users are seeking to give better data to individual store managers and to off-load data from the corporate mainframe.

A technology unique to retailing, the mainframe-based point-of-sale terminal is reaching a saturation point in the largest U.S. retailing

segments, according to IDC. The market was \$342 million in 1984, and IDC expects slow growth to \$540 million in 1988. In fact, most of the large retailers are on their second- or third-generation POS system already.

The vendors selling into this market — NCR Corp. and IBM are the largest — must start looking for business in upgrades, add-ons and service or must start penetrating the small and

medium-size retail outlets that have thus far eluded them. Kleinberger, however, says he believes that POS terminals might be considered "the most important piece of technology ever to hit the retail industry." A POS system functions as both a sales transaction device and a management reporting device.

Rather than looking at it as a saturated business, Kleinberger says retailing is

at the beginning of a new generation of POS terminals that are based on microcomputer technology and thus are programmable and more flexible and powerful than their predecessors. IBM recently introduced its latest POS system, the 4680 Store System, using a Personal Computer AT as the in-store controller.

"When we look at the trends," Kleinberger says, "the changes we see are not

so much in the technology but in the way POS terminals are used in the store." There is, he points out, an increasing trend to put some of the power and information provided by POS terminals into the hands of store managers. This is being accomplished by linking POS terminals to micro- and minicomputers that support in-store system needs such as credit management, merchandise information, price-change control

The printers of Texas

The printers you need when

Model 500: The 500 easily handles nine-part forms in high-speed retail applications. Its proven reliability and long life have helped make it the market leader in forms printers.

Model 502: The 502 is the perfect printer for LCD read processing. Its innovative font modules are available in over 30 type styles and special character sets.

Model 503: The 503 is the perfect printer for high-speed retail applications. Its proven reliability and long life have helped make it the market leader in forms printers.

Model 504: The 504 is the perfect printer for high-speed retail applications. Its proven reliability and long life have helped make it the market leader in forms printers.

Executive Report Retailing

and receiving.

NCR's Carl Steinmetz, vice-president of retail systems, agrees with Kleinberger's assessment. "We're expanding our POS systems to complement the main-frame environment," he says.

The systems are modified to solve a particular retailer's needs, Steinmetz adds. "Our customers are asking for many things, but the pervasive term I hear is 'distrib-

uted processing.' People are getting away from batch orientation and distributing more and more information down to where it is needed to make decisions."

Steinmetz says he believes that MIS in retail is just beginning to understand the value of distributed processing through POS systems in its stores. "MIS is choked with applications demands from headquarters," he says. "And end users are starting

to see that there are packages out there that can help them without waiting six years to get what they want."

The in-store systems are further being linked with headquarters and the distribution centers to form sophisticated communication networks that speed up the flow of data and messages through electronic mail. IBM's Brill points out that sophisticated retailers such

as Carter Hawley Hale Stores, Inc. are embracing such technological breakthroughs as electronic invoicing with suppliers, thus avoiding overdue bills and telephone tag.

"Electronic ordering can be awfully important for the bottom line," Brill says. "Information itself creates paper, which needs to be rekeyed into the system. With electronic ordering, decisions can be made faster and bet-

ter. There are certain kinds of merchandise that stores should never be out of. This will be like just-in-time delivery. It's an area that is poised to take off."

The personal computer, now a ubiquitous member of most large retail offices, is also making dramatic changes in small and medium-size companies. Small micro-based systems are allowing retailers without Sears-size budgets to automate (see story page 50).

Also on the horizon, though not as close as once thought, is videotex, or shopping at home. Sears, for example, is involved in a videotex joint venture with CBS, Inc. and IBM called TriStar. As home computers proliferate, videotex may well become an added MIS responsibility. After a spate of publicity five years ago, videotex has thus far failed to live up to expectations, but Sears' Carlson says he believes in videotex's potential.

"It may not replace the shopping mall, but that capability is going to become part of American retailing down the road," Carlson says.

The bottom line: Serving the customer

As was mentioned at the outset, America's shoppers, the retail customers, have yet to recognize significant benefits from retail automation. Perhaps that is because the retailers have concentrated initially on improving profitability and are only now turning toward customer service.

According to Kleinberger, real opportunities for retailers will continue to build as applications development shifts toward marketing functions and sales promotion. "These areas," he says, "will require the next big wave of systems development investments."

Kleinberger predicts retailers will realize a more competitive position by using their information systems to develop special services for their customers.

"Such concepts as direct product profitability will allow retailers to focus assortments more effectively," he explains. "Data base technology will lead to huge databases of customer information, competitive information and demographic data that will permit retailers to understand where opportunities really are by customer segment and classification."

In the long run, the goal for retailers is simple, as expressed by Zayre's Bliot. "With new and better systems, we hope to stay one step ahead of everyone else. We want our customers to sense that our store is a better place to shop."

Instruments. your needs are demanding.

Model 880: The 880 is the most chosen high-speed, high-capacity printer. Its performance, speed, reliability, and low cost make it the most popular choice for many businesses.

Premium performance and industrial quality. That's what TI printers are known for. Their reliability has always been standard-setting. Their throughput, consistently high. And their quality surpasses the needs of their applications. Which means few, if any, failures and a minimum of downtime. In fact, about all the service a TI printer needs is a paper or ribbon change.

The reason is simple — every TI printer is made to do its job very well, for a very long time.

The Model 810. The workhorse. For almost a decade, the Model 810 heavy-duty 150 cps system printer has been printing forms and data reports in virtually unattended operation. Its performance has been so reliable that it's the choice of most of the world's major airlines for ticket counter service for one reason. If they aren't printing tickets, they aren't making money. We even took the 810's field-proven architecture and put it to work in our Model 880 system printers. You can't argue with success.

The Model 880 Series. The 300 cps heavy-duty system printers.

Our 880s are the perfect upward migration and high-speed complement to the Model 810. They're twice as fast, fully compatible with the 810, offer correspondence-quality printing, raster graphics, and come in three models — the standard 880, the 880DP and the 880AT. The DP model offers the highest throughput necessary for high-speed data processing forms and report printing applications. And the AT model is ideal for multi-user environments because it is both hardware- and software-compatible with AT- and XT-class personal computers.

TI's micro-printers. They make more out of any PC.

Dual-mode, letter-quality, color printing and graphics, too. However you use your PC, there's a TI micro-printer to match. Our micro-printers feature front plug-in fonts, easy-to-use control panels and a long service life. They're

also compatible with virtually all PC hardware and third-party software. Available in both 80- and 132-column carriage models.

Now, our OmniLaser™ Printers. TI's answer to the shared-resource laser environment.

The TI OmniLaser family of printers is the very first of the second generation of laser printers. Why did we wait? Laser printers of the first generation couldn't live up to our standards for function, quality and reliability. In fact, our OmniLaser printers are documented to last up to 15 times as long as their first-generation counterparts, with the lowest cost per page in the industry.*

To be TI printers, the OmniLaser had to print unerringly at incredible speed with unrivaled quality. And they had to be simple to use. The OmniLaser Model 2015 will last in shared-resource work environments where lesser printers fail. They had to be the "810" of laser printers.

So if you're equipping a computer system with printers, or replacing those you already have, demand the printers that fit your demanding needs. Call 1-800-527-3500. For the printers of Texas Instruments.

Doesn't your IBM PC deserve IBM service?

You chose an IBM Personal Computer for lots of good reasons. And now that you depend on it to help keep your office running smoothly, doesn't it make sense to help protect your investment with blue chip service from IBM?

No matter what IBM PC you have, blue chip service is more than just expert repair.

Blue chip service offers the choice of service that's right for you at the price that's right for you. It means we'll exchange your monitor, for example, at your place or at any of our Service/Exchange Centers.

And blue chip service means a lot of things you don't see. Quality. Speed. Commitment. And IBM experience. Every year IBM invests many hours of training to keep its service representatives current on technologies that never stand still.

As an IBM customer you deserve blue chip service. It's the best thing you can do for your IBM Personal Computer.

For more information, use the coupon or call 1 800 IBM-2468, Ext. 90, and ask for the Service/Exchange Maintenance Department.

Blue chip service from

IBM

Telecom: The new pawn in the IBM empire?

An international telecommunications network would greatly expand IBM's power. But only by winning the U.S. can IBM hope to win the rest of the world.

ILLUSTRATION BY DON MACINTOSH

By RICHARD THOMAS DELAMARTER

We have become a worldwide society of numbers... We define quantity using numbers... We now can reduce everything we do to a number language to be acted upon in machines.

— Commentary in IBM's Madison Avenue museum of calculating machines

If society continues to perceive itself increasingly in terms of information, "reducing everything" to an intangible but nevertheless valuable stuff — stuff that can be produced by machines here, made to flow there and processed, stored and sold according to the economic laws of scarcity — then the company that controls the technology for performing those tasks stands to gain enormous power over us all.

IBM has overcome all competition in the data processing market. The methods that have given it such great commercial success so far will be just as useful in the future for it to conquer the vast array of emerging information-related markets.

Consideration of IBM's growing economic and political power is rare in current discussions of this "information age" we are said to be entering, but a full understanding of this historical moment requires that the IBM phenomenon and its dire implications be grasped fully. Judging by the statements IBM makes to investors and to the public, it sees no bounds to its continued expansion. All that can be defined as "information" seems fair game.

What follows is an informed speculation as to the directions that this expansion is likely to take and how IBM will exploit its current monopoly to get there. Key to this analysis is the idea that IBM is seeking to

capture the high ground in the worldwide communications market just as it has in computers.

From that position, and from a further entrenchment in computing, will flow power in potentially every market that depends on interconnected computers — from telephones to robotics, from publishing to genetic engineering, from entertainment to banking, from education to public administration.

The first global telephone company

Soon IBM will become the first — and likely the only — worldwide telephone company. Working from its monopoly in computers and its growing strength in telecommunications, IBM will begin providing telephone services throughout the world and connecting people together on much the same scale as it now connects computers.

IBM the global phone company? Preposterous idea. Impossible, you might say. After all, AT&T is the undisputed world leader in communications. And all the nations of the world already have their own politically approved telephone monopolies in place. Besides, IBM makes its money processing data, not selling telephones or moving calls between them.

All true, but given the company's aggressive goals for future growth, its solid ties with virtually every substantial corporation in the world and its freedom to price discriminate across whatever boundaries it encounters, IBM the telephone company seems much more than just likely — it seems inevitable.

To see how easy it will be for IBM to establish the dominant global communications network, we need to consider a few basic facts. IBM's business continues to rely heavily on a relatively few large

corporations in the world — no more than a few thousand — for most of its growth and profits.

These companies' operations are dispersed throughout the world — a factory here, a marketing branch there — and each seeks to maximize its overall efficiency by integrating its international activities through telecommunications networks that carry data, voice, video and facsimile.

Although every interna-

tional office will not get its own mainframe computer, each will have telephones and most will have Telex terminals and small computers. As the complexities of global-scale business grow, corporate activities come to depend ever more heavily on the different networks of these various communications devices.

So much so, in fact, that there comes a point where it becomes economically compelling to combine all net-

works into one. Costs are reduced, performance and function are boosted, and control is enhanced.

An illustration on a recent Citicorp annual report boasts not of bedrock money vaults or of smiling tellers, but rather of the communications satellite that forms the heart of a global Citicorp network.

To be sure, not all transnational companies can justify owning their own satellites, but all want to avoid

the headaches and expense of linking machines across national boundaries. As things stand today, each of the world's telephone companies is its own empire, a state-approved monopoly company that tightly controls communications within and across its national boundaries.

Those international telecommunications treaties and agreements that do exist have done little to erase the differences among each

country's pricing, network interfaces and range of services. Each country's telephone service is unto itself, shielded since its earliest days from technological and regulatory advances elsewhere and purposely kept different from others.

In the face of such diversity, IBM the global telephone company would surely be welcomed by large corporations that, don't forget, are already the heaviest users of IBM computers and related networking products.

IBM could conceivably eliminate the hassles of running multinational telecommunications networks by providing much-needed services at prices lower than those charged by local phone companies. If problems arose

”

The methods that have given IBM such commercial success will be just as useful for it to conquer information-related markets.

RIP OFF THIS PRINTER.

Rip off hotel bills, airline tickets, invoices or any other type of form, up to six copies thick. Datasouth Demand Document printers put them out day and night, and let you rip them off without losing the next form.

Datasouth Demand Document printers feature bidirectional dot matrix printing at 180 cps. You can print to within 1/8 inch of the tear-off bar without affecting the next form. The push-button front panel and LED readout make

our printers exceptionally easy to use.

There's a Datasouth Demand Document printer for almost any communications environment. The DS 180 DD has standard Serial and Centronics-type parallel interfaces. The TX 5180 DD emulates the IBM 5256, 5224 and 5225 printers in System 34/36/38 environments. And the CX 3180 DD emulates the IBM 3287 in 3270 environments.

No matter what kind of form you're printing, there's a Datasouth printer that could be doing it better. So call us at 1-800-222-4528, and ask about our Demand Document printers.

When you consider all the money-saving advantages, it's really quite a steal.

Datasouth
AMERICA'S HIGH PERFORMANCE
PRINTER COMPANY

in a customer's international network, he would have to make only one call, to IBM, rather than hunt down the problems from country to country, vendor to vendor.

Transcending national boundaries, as it is already attempting to do with a series of well-placed communications satellites, IBM would become a one-stop shop for all sorts of telecommunications gear and services. It could piggyback voice, video and other communications channels on its firmly anchored data networks.

One-stop shop

IBM has already taken many steps toward this goal. It has helped many of its big U.S. customers build multipurpose networks on a national scale. There seems to be nothing to stop IBM from helping them expand internationally.

In 1984, IBM paid \$1.25 billion to purchase Rolm Corp., a leading maker of small communications switches. Then, in late 1985, IBM dropped broad hints that it would soon enter the telephone central switch market as part of an effort to double its sales of telecommunications gear in Europe.

It also invested heavily in MCI Communications Corp., a long-distance telephone carrier. IBM has worked closely with Motorola, Inc. and the Public Broadcasting System to establish a nationwide network for radio links in the U.S.

Meanwhile, throughout the world, IBM and its agents are lobbying intensely for rapid deregulation of local

In Depth/Telecom and the IBM Empire

telephone monopolies.

An international telecommunications network would greatly expand IBM's power. IBM could change network interfaces and exclude competitive computer equipment as it desired, thus limiting other equipment vendors' competitiveness.

Once its global network was sufficiently established, there would be an irresistible attraction for even corporations using non-IBM computer systems to attach to it — if only to make efficient links to other companies' computers — and to eventually do all their data processing with IBM systems.

IBM could bundle communications with data processing into a single priced service offering, thus again enjoying the benefits of a lease-oriented business. The possibilities seem unlimited — and scary, to the world's many phone companies.

These companies rely on the same large commercial enterprises as IBM does for most of their profits, and they do not want to miss out on data communications as a major growth market. Once IBM is able to service those large customers in a way that nationally confined telephone companies cannot, the latter would begin to lose that high-profit commercial business while still being obligated to provide telephone service to low-profit residential customers. IBM, of course, would escape all such obligations.

'Natural' monopolies

To understand the great advantages IBM holds over all the world's telephone monopolies, including the giant AT&T, requires a comparison of its structure to theirs. In most countries, the telephone authority (usually known as a Postal, Telephone & Telegraph, or PTT) is considered to be a "natural" monopoly and either is an arm of the government or is at least held politically accountable through some sort of regulation.

But no matter what the method of control, the purpose of such regulation is to ensure sufficient revenue to cover the necessary costs while achieving political and social goals. IBM, on the other hand, is not officially perceived to be a monopolist and has avoided all regulation. It is free to do as it pleases.

Once governmental supervision is in place for one purpose, it may begin to intervene in other ways. Often there is a belief that by tampering with the natural monopolist's pricing structure — for example, by systematically discriminating between different classes of customers — the total value of the service may be improved relative to what would result from purely

cost-based pricing.

In theory, everyone benefits from such governmental tampering. As the regulators transfer funds from one part of the monopoly to another, its overall profits are kept stable, enabling the average price paid by the majority of subscribers (in other words, residential customers) to be kept low.

This same pricing pattern has been in place throughout the world for decades, although the degree of dis-

crimination varies by locale.

In Japan, for example, the prices of long-distance calls in 1985 were 40 times higher than underlying costs would dictate, while in the U.S. the comparable factor was only six. In Europe, to take another example, the monthly rental for the private, 10-kilometer voice circuits typically used by business customers varies from \$129 in West Germany to only \$24 in Sweden.

These price differences

99

Once its global network was sufficiently established, there would be an irresistible attraction for even corporations using non-IBM computer systems to attach to it — if only to make efficient links to other companies' computers — and to eventually do all their data processing with IBM systems.

Campbell Soup, Smith Barney, The Commonwealth of Virginia and USAir have all benefited from Peat Marwick's unequalled information systems development experience.

Maybe you can, too.

In an area where experience really counts, you can count on Peat Marwick. Our experienced systems consultants bring you the highest level of expertise, whether your project involves systems planning, custom design and development, packaged software implementation or software re-engineering services.

Peat Marwick's systems consultants average more than ten years' experience. What this means to you is an unequalled opportunity to get more out of the system you are planning, developing, implementing or maintaining. Our consultants provide high quality, and reliable consulting services that will help take the risk out of your critical systems projects. And they will follow through to insure that your systems continue to perform at peak effectiveness.

You can benefit from the information systems skills that have helped some of the world's finest corporations and governments. For more information and a free copy of our systems brochure, "Meeting the Technology Challenge," send in the coupon below or call 1-800-344-3600. (In Illinois, call 800-328-4200.)

In Depth/Telecom and the IBM Empire

along with the large customers it depends on, pressure the world's PTTs either to change their pricing and provide better, lower priced services for commercial use or simply to let IBM provide communications services as well as computer systems wherever needed.

And IBM will prevail, for it holds significant advantages. It is less constrained by the peculiarities of each country's network and can eventually offer international data communications links that are optimized for use with its 370 line. Parochial interests restrict the abilities of the PTTs and prevent them from confronting IBM across the global front.

IBM has systems installed worldwide that can absorb great development costs and provide it with functional leverage into new markets. Its larger customers will surely take advantage of its global communications offerings, when they become available, and leave the PTTs to tend to low-profit residential and small business customers.

Ironically, it seems, IBM the unregulated monopolist is becoming the champion of unfettered competition, of more cost-based pricing in communications and of breaking the power of telephone monopolies everywhere.

The ill-fated governments of the world may fight rear-guard actions by putting up obstacles to the free flow of data across their borders and favoring local suppliers with contracts. But these governments will risk leaving their major corporate customers exposed to more efficient foreign competition in the most important service markets of the future.

Alternatively, foreign nations can accept the inevitable and join IBM instead of fighting it. Not only would doing so lower the direct expense of supporting their local computer companies, but it would also ensure that local banks and other service suppliers are not burdened with relatively inefficient non-IBM communications. IBM has a wide range of sweeteners with which to placate obstinate PTTs and foreign governments. It can purchase equipment from local suppliers — which it did to the tune of almost \$2 billion in 1984 from more than 50,000 suppliers in Europe alone — as well as invest in local plants and make cooperative arrangements with local schools, research centers and companies.

Of course, no matter what deals it offers the nations of the world, IBM's success in global communications requires that it actually have the necessary productivity-enhancing computer and communications systems its customer-partners need.

As we have seen, the company's communications marketing record leaves much to be desired. Besides ignoring customers' desires with its deliberately perverse 3705 controller, it failed several times to build a marketable PBX product.

In the end, IBM was forced to shop around for an entire PBX company and ended up paying a premium price for Rolm.

Most telling, however, are the company's great difficulties in getting its unreasonably diverse set of incompatible computer families to communicate effectively with each other.

But even if it takes IBM years or even decades to get its communications act together — recall that it

Ironically, it seems, IBM the unregulated monopolist is becoming the champion of unfettered competition, of more cost-based pricing in communications and of breaking the power of telephone monopolies everywhere.

took IBM many years to make the OS operating system work properly — it still stands to win the global communications market against all foreseeable challengers.

It will continue to monopolize the central hubs of future networks, the large-scale 370 mainframes, and that will give it profits and powerful leverage with which to improve its research and development of commu-

nications products (particularly software) and buy whatever else it needs.

IBM can marshal other resources. Simply by publishing more information than usual about certain interfaces, it can invite the rest of the industry to design and offer products that enhance any of its systems that are particularly deficient or that face strong competition.

The add-on business that such an "open architecture" strategy fosters is not permanently lost to IBM, of course. Once its customers are wedded to the IBM computer system that others have enhanced, and once IBM has designed its own add-on capabilities, it can begin to close the system's architecture to outsiders.

A subsequent variation of the original system may be designed to preserve customers' software investments even as it closes the door to others trying to attach products. IBM can begin withholding critical interface information that the outsiders need and limit customers' choices to its own high-priced products.

To be successful in its quest to become the dominant global communications carrier, IBM will, of course, have to best its U.S. rival, AT&T. Even divested of its Bell operating

CADDStation™

In Depth/Telecom and the IBM Empire

companies, AT&T remains the largest telephone company in the world, possessing substantial technical and financial resources. Like IBM, it receives most of its revenue from a relatively small number of large organizations.

Moreover, of all the world's communications companies, AT&T promises eventually to suffer the least from government interference in its management. The question arises, therefore, whether IBM will be able to dominate the all-important U.S. commercial communications market. Only by winning in the U.S. market can IBM hope to win the rest of the world.

IBM holds several advantages over AT&T. First, IBM alone has a strong worldwide presence, cultivated over the years with the world's largest companies. Only since it was

99

In striving to beat AT&T at home, IBM will likely appeal to its internationally active customers and develop computer and communications products that give it tremendous momentum in international telematics markets.

divested of its Bell operating companies has AT&T started to market abroad — and that without much success.

Second, IBM gets about half of its revenue from large computer systems, split evenly between processors (with memory) and peripherals; both those areas seem secure against dwindling competition and will show increasing profits.

At least as important is the fact that IBM is also free of all governmental scrutiny, so it can change prices and marketing policies quickly.

Finally, IBM is still free to price discriminate across whatever market segments it chooses through interface manipulation.

In direct contrast, AT&T was divested of its operating companies

precisely to prevent it from price discriminating and from denying competitors equal access to critical communications services, namely its vast network.

Though IBM relies heavily on both anticompetitive tactics, it has no obligation to defend itself in front of government regulators. AT&T must defend itself and will therefore be relatively incapacitated.

In striving to beat AT&T at home, IBM will likely appeal to its internationally active customers and develop computer and communications products that give it tremendous momentum in international telematics markets.

Only if AT&T and the PTTs can provide foreign businesses with function and performance at least comparable to that available from IBM can they stop IBM.

Cooperating in a hurry

To supply such products, of course, would require unprecedented cooperation between the PTTs in unifying their now-disparate networks as well as the ability to deliver products as quickly as IBM and its school of helpers can. Otherwise, customers will increasingly turn to IBM for connection of their IBM computer systems and for an increasing portion of their overall telecommunications needs. Any nation that resists may well lose more than it gains.

Already, it seems, PTTs have seen the handwriting on the wall and are competing with each other to make the best possible deal with IBM.

IBM has developed a national videotex system and an automatic telephone information service, called Audi, for the West German PTT. It is working closely with British Telecom. And with Japan's Nippon Telephone & Telegraph Public Corp. (NTT), it is building a value-added network for the Japanese market. It will likely attempt to install the same technology in other nations as well.

All the major computer and communications companies in Japan opposed the NTT deal before it went through — understandably, since they saw it forcing them to compete with a local telephone monopoly as well as with the world's computer monopoly. NTT, some predicted, would soon become a major sales agent for IBM.

Indeed, one wonders why NTT and the Japanese government agreed to such a deal. It appears that IBM got some help, however.

According to one informed observer, such a joint venture would have been unthinkable just a few years ago, but trade frictions between the U.S. and Japan were so bothersome in 1985 that the government resistance softened considerably.

The U.S. government, pressured by semiconductor and communications companies at home, lobbied in Japan to have NTT open its equipment procurements to non-Japanese companies in reciprocation for similar openness in the U.S. Significantly, when the door opened, IBM was the first in.

Thus is set a pattern we are likely to see repeated for years to come as Washington goes to bat for its own national champion, IBM. Meanwhile, the company is setting its sights on a broad range of other markets that depend directly on computers and communications.

MANAGEMENT

Norton markets its MIS

Unifying effort counters effect of decentralization

By David A. Ludlum
WORCESTER, Mass. — Coke or Pepsi it's not, but Norton Information Services (NIS), which runs the corporate information center for Norton Co., illustrates a growing emphasis on marketing to promote MIS services.

The marketing is aimed at drawing more clients to services from which information center managers feel the company will benefit, particularly in countering side effects of information systems decentralization.

Norton, with 18,000 employees in 27 countries and revenue of \$1.2 billion last year, is itself a highly decentralized, far-flung operation, with 18 strategic business units worldwide producing grinding wheels, coated abrasives, ceramic products, oil, refined ores and other products.

The company's information systems, too, are thoroughly decentralized. Although there are corporate systems, run on an IBM 3083 and 4381 at its Worcester headquarters, there are no corporate-wide software standards or controls on computer purchases.

One unifying function is the NIS corporate information center in Worcester, which was merged with an information center for Worcester-area operations one year ago.

NIS has promoted its services with flyers, posters, T-shirts and gifts, all emblazoned with the company logo. The organization also publishes a newsletter, runs articles in other internal publications, meets one-on-one with managers at all levels and makes group presentations.

The marketing effort is driven chiefly by competition from outside suppliers, according to Edward Gaudette, manager of

INSTANT ANALYSIS

"You can't install a vision. You have to install specific projects in a step-by-step fashion."

— Louis B. Hughes, senior vice-president, information systems, Equitable Life Assurance Society of the United States

TAKING CHARGE

Alan E. Bell

Reality-based scheduling

Projects, I've noticed, tend to take longer than we think they ought to. Lately, I've been trying to figure out why that is, and I've made a breakthrough that I want to pass along to you.

I like you, think I can estimate how long data processing projects ought to take. Then, based on experience, I add a correction factor to form my estimate. But that correction factor always bothered me, and I tried to determine why I needed it. The problem was that when ever I looked at the tasks in the project one at a time, my estimates seemed good. But somehow, put together, the time was insufficient. What could explain the difference?

I thought about it in the office. I thought about it at home. But the answer didn't come until I thought about it on vacation at Club Med. I realized, as I considered the matter over a pina colada, that while I was on vacation for that week I wasn't working on a project at the office. And I wasn't working on projects when there was a holiday. When I was sick, when I was in a training session or attending a convention or even when I was filling out my time sheet.

The problem, simply put, was that I had always managed under the assumption that if a project required 36 months of work, assigning three staffers to do it in a year would do the trick — assuming the tasks overlapped sufficiently. Of course, as we've all found

Brill is Director of Computer Security Services for the New York City Department of Investigation.

By Donna Raines
REDONDO BEACH, Calif. — User engineering, a technology blending computer and social sciences, is shaking up traditional computer systems development methods at TRW, Inc.'s Defense Systems Group.

A TRW official says the technique gives end users what they really need instead of what they think they need, drastically reduces the life-cycle costs of systems and reduces the risk of building systems nobody wants to use.

"We are combining people who are sensitive to people with people who are sensitive to technology," says Larry McLaughlin, user engineering project director at the company's Systems Development Division.

To build systems designed for users' work styles, McLaughlin's development teams use psychology, sociology and anthropology to identify users' work habits,

learning methods and preferences. Then TRW builds prototype applications, which go through many iterations before being written in final code.

In the late 1970s and early 1980s, TRW built some U.S. Army and intelligence applications that were unacceptable to users, even though the company studied what the users wanted, had users approve specifications and built the systems to them.

"It was a failure of people to understand how they really work and what kinds of information they really needed. They didn't understand how their minds and their cognitive processes work and how their work styles really fit with some sort of automated information," McLaughlin says.

The five- or six-person user engineering teams, using human resource studies and consultants, determine where the power is

Development taps social science

System break-ins raise concern over electronic terrorism

Unix users hit hardest in nationwide entries

By Jeffrey Beeler

A recent rash of system break-ins drew nationwide attention to the extreme vulnerability of virtually all processor architectures to electronic penetration, according to information security consultants.

The intrusions, which have occurred nationwide and chiefly involved large Unix users, have also rekindled fears among some experts that U.S. systems could someday fall prey to electronic terrorism, with devastating consequences.

Philadelphia-based security consultant Ian Murphy, for example, invokes images of skilled saboteurs

who secretly invade a commercial system, write logic bombs or other deliberately destructive programs and conceal them in the user's software for later activation. With little trouble, the same procedure could be duplicated "all over corporate America," claimed Murphy, founder of IAM/Secure Data Systems, Inc.

Potential vulnerability

Murphy's colleagues agree with his thesis that many systems are potentially vulnerable to security breaches and could be disabled by an attacker with sufficient skill, persistence and ruthlessness. Although electronic terrorism may be technically feasible, it may be ineffective, according to SRI International, Inc. security consultant Don Parker.

Unless it was exceptionally con-

spicuous, an act of electronic sabotage would yield little of the publicity and recognition terrorists often seek because the victim would do everything possible to keep the embarrassing attack a secret, Parker said. Thus, explosive bombs and other conventional terrorist tactics might be better suited to a political extremist's purposes than logic bombs.

The debate over whether electronic terrorism constitutes an immediate and serious threat was revived recently when yet another band of electronic intruders made U.S. systems sites the objects of unwanted attention.

Interlopers

Apparently armed with stolen access codes and phone numbers, the interlopers called and illicitly en-

tered systems at Lawrence Berkeley Labs, MIT, Mitre Corp., Stanford University and the University of Illinois. Many of the penetrated systems contain data on nonclassified military and other government research.

At Stanford, the invaders did little more than rummage through files and create some fake accounts, said Lester Earnest, associate chairman of the university's computer science department. One of the accounts bore the password of "P. Floyd," which gave rise to the apocryphal theory that the intruders were the work of a lone hacker nicknamed "Pink Floyd."

"No one ever called himself Pink Floyd," Earnest said. "In fact, the trouble wasn't the result of just one individual. It was caused by at least

See SYSTEM page 66

ON AT&T'S "HIGHWAY 3B" THERE ARE NO LIMITS ON WHERE YOU CAN GO WITH COMPUTERS.

Like it or not, the multi-system environment is here to stay. Mainframes will be mainframes. PCs will continue to proliferate like mosquitoes. And user needs will change every day.

It is high time somebody created a family of computers for an evolving mixed-system environment. The time is now. The "somebody" is AT&T.

Our 3B computer family is among the first to blend the technologies of data processing and communications. Result: a unique ability to distribute processing

power across system lines, from user to user, desktop to department, and department to mainframe.

AT&T's 3Bs are easily linked up to IBM* mainframes and down to any combination of terminals, peripherals, and MS-DOS** PCs. The idea is to open communication between

COMPUTERS WITH THE FUTURE BUILT IN

3B2/300. Supports up to 34 users, 32 KSCSI/C ports. Speed: 1.1 MIPs, 32 bits at a time. All 3Bs are 32-bit machines. Storage: 66MB internal hard disk; up to 540MB with Expansion Modules.

3B2/400. Supports 30 to 35 users, 48 KSCSI/C ports. Speed: 1.1 MIPs. Storage: 175MB internal, to 660MB with Expansion Modules.

3B2 X-M. Expansion Module adds 25MB cartridge tape storage and/or 30 to 72MB hard disk storage.

3B4. Serves 10 to 20 users, 22 KSCSI/C ports. Speed: 1.6 MIPs. Supports 8 drives, with maximum storage of 2.7 gigabytes.

Not shown: Other members of AT&T's 3B computer family serve up to 100 users, across a wide range of business needs and environmental conditions.

© 1986 AT&T

systems—without forcing users to give up the applications they know and trust.

In most offices, the effect on productivity is electric.

"THESE GUYS THINK OF EVERYTHING."

The 3B's role in a distributed data processing environment can grow and change as your business evolves. For starters, UNIX™ System V permits the same software to run on a variety of machines, protecting your investment in applications and user training.

On the hardware side, the whole 3B family is like a big set of building blocks. Everything is modular. A system of feature cards and interfaces makes it easy to add functions or peripherals. Or add users. Or boost performance. Or all of the above—in any order, at your own pace.

Example: A 3B "starter" system that is cost-efficient for 6 users can easily grow to serve 60 users—and more—with the same efficiency. By networking 3B to 3B you can support thousands of users—like adding beads to a string.

Whether those "beads" are down the hall or an ocean away, AT&T's networking tools can swiftly unite them all into a single, flexible, responsive system.

WHERE ARE YOU GOING?

AT&T's 3B family was created as a family to enhance the systems you have today, without imposing limits on where you can go tomorrow.

You can start with the pieces you need to solve today's problem: linking mainframe and desktop, say; or pulling together a department. As your needs and ambitions change, so can your system. AT&T makes the pieces fit.

To learn how much we can do for your company today, and how far we can take you tomorrow, please contact your AT&T Account Executive, authorized supplier, or telephone 1 800 247-1212.

microDCF™

The DCF3 Compatible PC Text Processing System

With the powerful document composition capabilities of microDCF you will be saving time and cutting costs. Use your low cost PC AT or XT and your local printer. Capitalize on your existing skills. Save your company a fortune by taking Script work off the mainframe.

Features

- IBM Script language
- IBM GML Language
- macro libraries
- symbol support
- multi-pass processing

- high performance
- laser printer support
- includes text editor
- table of contents
- back-of-book index
- and much more...

MANAGEMENT

Reality-based scheduling

From page 63

out, it doesn't, because three people working for a year do not provide 36 months of work on project tasks.

Let's consider a typical working environment in a large company. Where is time lost from projects? Here are some places. You can add others that affect your company:

- Vacation: 16 work days.
- Illness: five work days.
- Holidays: 10 work days.
- Training: eight work days.
- "Administrivia": seven work days (that's one hour per week).

Subtotal: 46 work days (nine weeks).

Of the remaining 43 weeks, are there any data processing managers with more than 10 minutes' experience who believe that everyone is 100% devoted to project tasks? We have to add in a productivity factor. My gut feeling is that if we get 85% productive efficiency, we're doing well. That translates to an added loss of 6.45 weeks per year.

That gives us a total nonproject time of 15.45 weeks, which translates to a 30% loss. This leads to the somewhat depressing but true conclusion that in order to accomplish 12 months of project tasks, you have to obtain just more than 17 calendar months of staff time.

That, to me, was a staggering figure. I hadn't been adding that much to my estimates for what I thought of as a safety factor. Yet when I started to do so, projects started to

come in on time. We didn't have the annual crises of projects falling behind because of vacations. And we didn't have managers pleading with employees to defer their vacations to finish various vitally important projects.

Since these days nothing seems to exist without a snappy name and acronym, I vote to adopt the name "Reality-Based Scheduling," or RBS, for this process.

And I want to propose you for membership in the Association of Reality-Based Schedulers.

There are no dues and no meetings. Your only obligation as a member is to calculate for your company what the various loss factors are in both time and efficiency. I suspect there may be industry norms that you should know about, and possibly regional norms.

If you will help me collect the data, I will calculate the averages and spreads and report them to you in *Computerworld*.

To participate in this self-help effort, just send me a copy of your calculations. You need not reveal your company, but please list your industry and location.

For time-loss factors, provide time estimates in days per year. For efficiency factors, provide your estimate in terms of percentage of available time devoted to actual project tasks. Please send your data to me at 108 Genesee Ave., Staten Island, N.Y. 10308.

The alternative to RBS is missed deadlines, aggravating crises and the feeling that you're not in control. By spreading the word on RBS, you'll help to ease the pressure and manage more effectively.

Development taps science

From page 63

in a user organization, what its informal working relationships are, how decisions are made and how information flows.

The approach McLaughlin developed includes four elements that he considers critical to success:

- The multidisciplinary team.
- A process that is creative rather than analytical or reductionist.
- A prototyping environment that simulates the user workplace, with the appropriate furniture, books and bookcases and lighting.

• A user interface management system, a prototyping tool that lets designers build prototype screens.

"We produced, in two months, a view of a bathymetric [water depth] data integration system that would have taken five or six times as many people a year to produce. And we might have never produced it on paper, because the iteration and creativity that go on in a small team just doesn't happen in a large paper-writing team," McLaughlin maintains.

In addition to the successful prototypes, user engineering teams have found that some applications turn out to be too costly to build. A mapping project prototype showed that using pencil and eraser processes on a light table was more cost-effective and reliable for a particular group of users than building a computer graphics system on workstations.

Understanding users' needs

Part of what makes this approach to computer engineering valuable comes in understanding that users have different needs, McLaughlin says. They might be analytical or intuitive, introverted or extroverted and have varying needs for structure and adaptability.

While not every system needs to be finely tuned to users, critical decision-making aids should be, McLaughlin says.

"In a system in which a commander needs to make a decision in a certain length of time from information which may be greatly detailed in some areas, vague in others and conflicting in others... we need these techniques to provide the best decision-aiding," he says.

INTRODUCING INTELLECT/DB2 USING AI TO DELIVER DB2 TO MANAGEMENT

INTELLECT/DB2 dramatically enhances your investment in DB2 by making it accessible to managers in plain English. INTELLECT/DB2 was developed by Artificial Intelligence Corporation, the pioneer in commercial AI technology and the creator of INTELLECT, the natural language software used by hundreds of organizations worldwide.

Attend a free seminar and learn the six requirements for delivering DB2 to management.

1. NATURAL LANGUAGE

INTELLECT/DB2 allows managers to ask questions of a DB2 database in English. Its advanced AI techniques allow users to request information in any way. It understands ambiguous questions, and lets managers use their own vocabulary, which it learns as it's used.

2. AD HOC ANALYSIS

INTELLECT/DB2 enables managers to get answers to complex questions easily. Statistics such as totals, minimums, maximums and percentages, and complex functions including correlations and ratios need only be requested. Users see results displayed in summary form or graphs automatically.

3. APPLICATION BUILDING

INTELLECT/DB2 users can build personal applications in English. Within security constraints, users can create and update tables, build forms for data presentation, and request reports.

4. PROPER USE OF DB2

INTELLECT/DB2 uses all DB2 capabilities to the system's advantage. And as a SQL generator, INTELLECT's interface to DB2 takes full advantage of DB2's power.

5. OPEN ARCHITECTURE

INTELLECT/DB2 users employ DB2 or other databases and file structures in many ways. With INTELLECT's PC Link, they ask questions on a PC, have the results from DB2 reformatted into a Lotus 1-2-3 worksheet, and sent down to a PC. And, advanced work in AI provides voice input to your DB2 database.

6. THE RIGHT VENDOR SUPPORT

Our 11 years of delivering commercial AI business solutions means you get expert assistance in using INTELLECT/DB2. You have access to complete product support, including a telephone hotline, training, consulting, and documentation.

See for yourself how using AI can help you deliver DB2 to management. Call our Seminar Registration Office today at (617) 890-8400, or return the coupon.

MANAGEMENT

MIS applies marketing

From page 63

end-user computing and office automation.

Users might go outside the firm for products and services because they see the services of outside vendors as faster and less expensive than NIS, Gaudette says.

"Often not thought of it that you don't get full understanding of how the company runs," he says. For example, the purchase

of an apparently inexpensive data base may not look as good if the user later finds he wants to share data with fellow workers who use incompatible products, Gaudette remarks.

NIS's marketing has also been propelled by the reluctance of many to take the plunge into computing, according to Janice Smith, supervisor of the corporate information center. "There's still an enormous task in moving people into an electronic age," Smith says.

Top managers are a particular challenge even in areas appropriate for them, such as timely international communication, she says. "We have reluctant management. We're trying to bring them along the learn-

ing curve to where they really trust what they're seeing on their screen as accurate information."

Developments that Smith attributes in part to marketing efforts include the signing of 700 users for the corporate electronic mail system introduced in March and the expansion of NIS's two-day retreat for computer training, known as Computing, Awareness, Motivation and Perspectives (CAMP) [CW, July 28], to eight sessions this year from three last year.

The Norton managers do not have a dollar figure for the cost of their marketing efforts, but Gaudette says,

"You're not talking about a whole lot of money." Smith, who started marketing information services while running the defunct Worcester-area information center, suggests the costs of not promoting the services far outweigh the costs of doing so.

The benefit of providing the corporate services, she says, is keeping information centralized and accurate.

"We have duplicated the MIS department in every strategic business unit and, in a lot of cases, we have duplicated systems so that the information is in more than one place," Smith says. "The cost of having it in a lot of different places and not even knowing that — you couldn't even estimate it."

System break-ins raise concern

From page 63

three," he added.

Murphy, who was once a pirate hacker known as Captain Zap before being arrested and convicted for fraudulently ordering merchandise by computer, views the recent break-ins as an attempt to expose Unix's glaring defects.

"Whoever is behind these incidents is definitely on a mission," he said. "He's telling people that, from a security standpoint, Unix is trash, and he's right. Unix is very functional and compact in its operation, but because it is an open architecture, its security is Swiss cheese."

So far, none of the intrusions have damaged the victims' data or programs. "These people just seem to be trying to demonstrate that they can log on to various systems," Earnest said. "From our standpoint, the security violations were a non-event. Incidents of this sort happen dozens of times a year in an open environment like ours."

But if systems security is being violated by hackers who are comparatively benign, "we probably have to assume that some malicious ones are also doing the same thing," says Bob Campbell, president of Woodbridge, Va.-based Advanced Information Management, Inc.

To make matters worse, the threat is by no means restricted to systems

running under Unix.

"Some of the individuals and groups that are breaking into systems these days are developing specialists," Campbell said. "A lot of the bulletin boards, for example, are carrying tutorials by people who are experts in getting into Digital Equipment Corp., Hewlett-Packard Co., Data General Corp., IBM, NCR Corp., you name it. The tutorials often go into a lot of detail about how to work your way through a system's protocols and reach an executive or supervisory state."

By using pirate bulletin boards and other techniques such as bugging and wire tapping, hackers have already acquired the necessary passwords and logons to enable them to cripple numerous corporate systems. Favorite targets include voice and electronic mail networks.

"Typically, intrusions begin with a lone intruder who scans the systems and posts key operational details on an underground bulletin board."

Although many user organizations have already been seriously harmed by breaches of information security, most companies still treat the problem with indifference, consultants say.

In general, the business community remains dangerously naive about the hacker subculture and its capacity for causing trouble, Murphy said. "Many businesses have absolutely no idea of what's going on with hackers and take the mistaken position that bad things always happen to the guy down the street, not to them personally," he said.

Sicob 1987 - The World Business Show

4 --- FASTEN YOUR SEAT BELTS!
The international business forum of the year awaits you. Now your ambitions can really get off the ground.

3 --- GET READY FOR DEPARTURE!
Exhibitors from all over the world will be coming to take advantage of the multiple direct contacts that only SICOB can offer.

2 --- ALL SYSTEMS GO!
The latest in data processing, telecommunications, duplication, office organisation and office automation will be on board from April 6th to 11th. Fly with the VIPs at the Data Processing, Office Automation and Office Organisation Conventions.

1 --- TAKE OFF INTO SPACE!
Discover Paris-Nord, the most modern exhibition centre in Europe. 118,000 m² of the latest advances in technology.

GO! --- SICOB 1987 THE WORLD BUSINESS SHOW.

SICOB
SEE THE LATEST. SEE IT ALL.

WHICH VM IS RIGHT FOR YOU?

VM/IS, VM/SP,
VM/XA/SE, VM/HPO,
OR VM/PC.

**READ THIS
FREE
BOOKLET.**

ALL YOU
WANTED TO
KNOW ABOUT
VM...

BUT
DIDN'T KNOW
WHO TO
ASK.

Once the forgotten child, VM is becoming the "darling" of the IBM operating systems. Small wonder. With its flexibility, interactive qualities, and excellent host talents, it's the perfect answer to the needs of a growing number of companies. But with VM's versatility come questions — with five different variations to choose from.

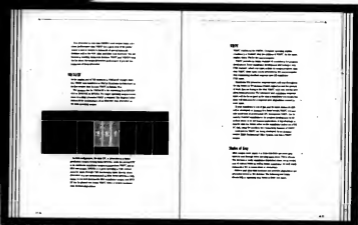

This helpful booklet sorts through all the VM 'flavors,' telling you how to compare the available VM systems based on your current needs, your possible future needs, and your budget.

AREAS COVERED IN THE BOOKLET:

Defining Your Needs

The selection of a VM operating system variation depends greatly on your current and future needs, what applications you run.

Whether your requirements include CAD/CAM, graphics,

scientific application, application development, artificial intelligence, office automation, information centers, or whatever — this comprehensive booklet will help you define your needs and choose the right system variation.

The Different VM Operating System Variations

A basic primer on the five basic VM variations now available: VM/Integrated System, VM/SP-System Base, VM/XA/SP, VM/HPO, and VM/PC...including all their advantages and disadvantages, machine requirements, and cost considerations.

Matching The VM System To Your Hardware

VM System variations all differ in the processors they can use...and the printers and other hardware they can support. This booklet gives you the guidelines to get the perfect system for your machine...or vice versa.

The Use of Guest Systems

VM is the perfect host for other operating systems such as DOS and/or MVS. (It's also the perfect referee when you use the two systems together.) This booklet suggests system variation guidelines if you need to use more than one system...and which VM combination can best meet your needs.

Financial Considerations

Apart from other considerations, it's important that the VM system chosen meets your budget. This booklet helps you through the budgetary process, and takes into account the cost of systems, processors, personnel, and support hardware.

Why This Book is Free...

VM Software, Inc. is the leading developer of system software products for all variations of the VM environment. The chances are very good that if you run, or plan to run, VM, you'll eventually purchase at least one of our products to enhance it. So it's in both of our best interests that you select the right VM variation from the start.

**FOR
YOUR FREE
BOOKLET**

About VM Software, Inc.

VM Software, Inc. develops and markets system software for IBM and compatible mainframes running under the VM operating system. With eleven products in over 8,000 installations, VM Software is recognized as the leader in the VM marketplace.

▲ **"An excellent overview of what's available in VM."**

"Clean and concise, with a no-nonsense approach to the choices."

"Simplified my decision-making process."

▲ **"Easy to follow. The charts are invaluable."**

"Don't leave DOS without it."

NEW PRODUCTS

Sytek's LAN makes room for the MAP

Sytek, Inc. of Mountain View, Calif., has introduced a high-band version of its System 2000 broadband local-area network, which can coexist on the same cable with a network supporting the Manufacturing Automation Protocol (MAP).

The System 2000 Highband is a modern board option for existing products that makes the future inclusion of MAP channels possible.

Previously, broadband channels allocated for the System 2000 overlapped with MAP channels. According to a company spokesman, System 2000 Highband can also share a broadband cable with the original low-band system, doubling the number of available transmission channels from 60 to approximately 120.

The System 2000 Highband family includes the 2502 Highband Packet Communications Unit (PCU), priced at \$1,195; the 2532 Highband Multiplexer PCU for \$4,400; the Highband Network Translator for \$3,000; and the 2555 Transistor Switch for Highband or lowband, priced at \$4,000.

Other System 2000 products unveiled by Sytek include the following:

- The 2602 High-Performance PCU, priced at \$1,295, and the High-Performance Interface Card, which costs \$696. Together, the products increase total network throughput from 10.2K to 38.4K bit/sec., enabling it to support high-speed applications such as graphics.

- The 5202 Network Bridge/Link Unit, for \$9,000, connects channels within the System 2000 network and performs automatic routing and traffic balancing.

- The 5102 Statistical Monitor, for \$2,075, collects network performance data and generates reports.

- Protocol Transparent Units (PTU) create a dedicated channel for connecting any set of compatible synchronous or asynchronous terminals and hosts. The 1301 PTU, for \$995, operates at 38.4K bit/sec. and supports RS232C ports; the 1302 PTU, priced at \$1,695, operates at 64K bit/sec. and uses an RS422 interface.

Firm upgrades VSAM tools

Software enhancements geared toward IBM MVS

Software, Inc. of Clinton, Md., has enhanced two of its VSAM support software products for IBM MVS systems.

The VSAM Space Manager is a direct-access storage device (DASD) space management utility. It is said to provide a volume pooling facility for VSAM volumes available to particular VSAM catalogs for allocation of data sets. When defining a VSAM data set by means of IDCAMS, the user can specify any volume. VSAM Space Manager will find the space needed from among the appropriate volumes, the vendor said.

The pooling facility also allows the installation to add and remove DASD volumes without impacting production JCL streams that allocate or reallocate space.

The Space Manager can also be used to limit the number of catalogs using a volume in an ICF environment and can reserve a cushion of space on volumes to ensure adequate space for secondary allocations. It allows specification of multiple volumes, components on different volumes and allocation of VSAM data sets, data spaces and catalogs by absolute track for performance enhancement.

A VSAM Space Manager site license costs \$13,425.

The VSAM Mechanic consists of a set of utility programs said to allow the installation to back up, restore, recover, analyze and repair VSAM/ICF catalogs and VSAM data sets. It provides facilities to back up catalogs in a format that allows them to be restored with different data set names, to different volumes and on different device types.

Additional features include facilities to synchronize time stamps, print VSAM records, indexes and control intervals, delete orphaned data sets and rebuild catalog-free record chains.

VSAM Mechanic is licensed by site for \$7,950.

Software also announced the availability of the VSAM Performance Series (VPS), consisting of VSAM utility software.

According to the vendor, VPS can reduce allocated VSAM DASD space. Features allow users to convert to new catalogs and device types with global commands and eliminate the need to manually find VSAM space on DASD volumes. Facilities are available to back up, restore and repair damaged VSAM/ICF catalogs and data sets. VPS operates with all MVS systems, the vendor said. Site licenses range from \$6,500 to \$35,000 depending on the options chosen.

TI adds Explorer configurations

Texas Instruments, Inc. of Dallas has announced new system configurations of its Explorer, which is a symbolic processing workstation based on 182M-byte disk drives.

According to a company spokesman, the 182M-byte disk, based on Winchester technology, is said to provide nearly 30% greater mass storage capacity than previous Explorer models.

Up to eight of the 5¼-in. disks can be supported by an Explorer. The average seek time is 16.6 msec, with a transfer rate of 10M bit/sec.

The 182M-byte disk drive is also available as a system option that can be added

to existing Explorer installations with an adapter cable.

The Explorer systems based on the 182M-byte disks are priced from \$39,000 to \$69,250. The 182M-byte mass storage options for existing Explorers are priced from \$8,500.

The Explorer symbolic processing workstation is used for development and delivery of artificial intelligence applications, such as knowledge-based systems and software prototyping and development. The Explorer is also used for research in artificial intelligence and other advanced computing technologies, according to the vendor.

Meet the Industry's New Standard for Mainframe C Compilers

SAS Institute Inc. announces a mainframe version of the Lattice® C compiler—your key to truly portable applications.

With our compiler, you can develop C programs on IBM 370 machines, interface easily with non-C programs and software packages, and protect

your programming investment across operating environments. Virtually every new computer supports C, and portable programs created with the mainframe compiler under OS or CMS will run on any other machine with a C compiler.

The mainframe compiler uses standard IBM linkage conventions. Assembler programs, MAIN routines in other high-level languages, and packages such as IBM's ISPF and GDGM can be invoked directly from C.

And you can use C, instead of assembler, to develop small and fast subroutines called from other languages.

We designed the compiler listing and cross-reference to make programs easy to follow and errors easy to find. An extensive library offers functions from Kernighan and Ritchie and the Lattice PC C compiler. The run-time library produces explicit numbered error messages and a traceback of active function calls if an error occurs.

For all the facts—including details on economical annual licensing complete with free technical support and enhancements—call your Software Sales Representative today.

NEW PRODUCTS/SOFTWARE & SERVICES

SOFTWARE
& SERVICES

Systems Software

Specialized Software, Inc. has announced **Tables2**, an enhanced version of its **Tables/1** table management product.

Tables2 is said to be a general purpose multifunction applications development system for designing and maintaining on-line programs using IBM's IMS-DB and DB2 and **Tables/1** within the IMS/DC framework.

The on-line system features a screen program generator, screen processor, table manager, DB2 interface and DB/DC dictionary interface.

The screen program generator of **Tables2** can be licensed for \$29,500.

Specialized Software, Suite 400, 90

Madison St., Worcester, Mass. 01608.

Westmoreland Software International, Inc. has released Version 6.4 of its **ADD System** for the IBM System/34 and 38.

The **ADD System** is said to generate RPG source code and documentation for reports, on-line inquiries, file maintenance programs and batch programs.

Version 6.4 includes a report writer language designed for non-programmers. Other enhancements include the ability to preserve modifications to RPG source code; access to screen attributes for fields; and enhanced manuals.

The **ADD System** is available for \$131 per month for a three-year lease.

Westmoreland Software, Suite 196, 863 E. Samoran Blvd., Casselberry, Fla. 32707.

Applications packages

The Bridge, Inc. has enhanced its **Trak** project management software for IBM and compatible mainframe users.

Trak 3.0 is said to operate with IBM's CICS or TSO. Additional features include a file of the employee's active tasks and a fill-in-the-blank time entry process; the ability to enter machine time, travel costs and supplies at the task level; summarize on-line or via reports; assign up to five users to one task; and share and allocate project costs with up to five departments. Projects and employees can be moved to other departments using the product.

Trak 3.0 is priced from \$12,500, with lease terms starting at \$480 per month.

The Bridge, 190 California Drive, Milbrae, Calif. 94030.

MCBA, Inc. has introduced its accounting and distribution software for the AT&T 3B family of computers.

The packages are written in R/M Cobol and run under AT&T Unix System V.

Software packages include Accounts Payable, Accounts Receivable, Bill of Material Processor, Customer Order Processing, General Ledger, Inventory Management, Payroll, Purchase Order and Receiving, Master Scheduling and Material Requirements Planning.

The packages are priced from \$1,500 to \$3,000 for object code only and \$2,000 to \$6,000 for source code, the vendor said.

MCBA, 425 W. Broadway, Glendale, Calif. 91204.

Utilities

Help/38 Systems has upgraded its RPG V coding system for the IBM System/38.

New features include the ability to generate work field names and definition, a tutorial program that teaches the programmer both RPG III and RPG V and seven new one-entry utility line commands, including a notepad enhancement and a function to make documentation easier.

RPG V is priced at \$996 per CPU. **Help/38**, 210 Baker Technology Plaza, 6101 Baker Road, Minnetonka, Minn. 55345.

MICROCOMPUTERS

Software applications packages

Vertical Business Software, Inc. has announced the **VBSI Manufacturer**, the Manufacturer with Process Control and the Garment Manufacturer.

The **VBSI Manufacturer** includes accounts receivable, inventory control, purchasing and billing and up to 10 levels of inventory, with the number of inventory items limited only by the size of the disk.

The **Manufacturer with Process Control** adds the ability to track production through the various stages, and the **Garment Manufacturer** adds the ability to track items by size and color, provides cutting tickets and maintains two sets of receivables.

The programs run on the IBM Personal Computer XT. **Manufacturer** costs \$1,600, **Manufacturer with Process Control** costs \$2,000 and **Garment Manufacturer** costs \$2,500.

Vertical Business Software, 662 Main St., New Rochelle, N.Y. 10801.

CORRECTIONS

Intex Solutions, Inc.'s **XYZ-Spread** [CW, Oct. 20, page 103] costs \$145 for a 12-worksheet version.

Transtech, Inc.'s **Traps** software system [CW, Oct. 27, page 88] uses an IBM Personal Computer for keystroke capture, editing and storage of test cases.

GUESS WHAT HAPPENS WHEN YOU COMBINE
THE STRENGTHS OF NYNEX AND SUNY COLLEGE OF TECHNOLOGY.

Partnerships have a way of producing results that defy the principles of basic math. Like the partnership we formed with SUNY College of Technology.

The challenge here was tying their computers together. They also needed a customized communications network to integrate their diverse information technologies—equipment from Gould, DEC and IBM, to name a few. A network that would give students, faculty and administrators access to any kind of information from any location on campus. Without needless delays.

The solution was the creation of a powerful communications and information system, using the latest in LAN technology, based upon IntelCom's IBM S/10 switch. The network integrated SUNY's existing technologies and, with the addition of Data General's ECLIPSE MV/10,000 computer and CEO software, significantly expanded the system's capabilities.

And we did it all. From designing the system to installing it, to thoroughly training everyone to use it. But our partnership with SUNY College of Technology didn't stop there. We also teamed up to create the Telecommunications Institute. Which not only offers a Bachelor's Degree program, but serves as a "living laboratory" for research and development in telecommunications technology as well.

What does all this academic achievement mean to your business? It means if you're looking for a partner to help you build your business information system, no matter how sophisticated it has to be, call NYNEX.

Because time and time again, our experience has shown that the whole is greater than the sum of its parts.

1-800-346-9X9X

NYNEX

Business Information Systems

Introducing IBM's smarter, snazzier, worldlier 5250 emulation adapter.

The IBM *Enhanced* 5250 Emulation Adapter lets you connect your IBM Personal Computer to a System/34/36/38. But that's only the start of it.

The Adapter's emulation software has been enhanced to allow for some remarkable new feats.

- It's smarter. Now you can run two System/34/36/38 sessions plus one PC program simultaneously (switching between them all just takes a simple hot key sequence).
- It's snazzier. If your PC has a color monitor, now you can use the Adapter to interact with your system's Business Graphics Utility Program and print your session on the system's plotter.
- It's worldlier. If your PC has a modem and an SDLC adapter, now you can use the Remote Emulation Program to interact with a System/36/38 most anywhere in the world.
- It's more flexible. Now you can have the choice of printing on your system's printer or on a variety of IBM and non-IBM PC printers.
- It's more memorable. Now you can have concurrent access to your PC fixed disk while you're still in a system session.
- And it lets you do more, a lot more. Including electronic mail, document distribution, and other functions available with IBM's office applications.

Introducing IBM's smaller, smarter, faster 3278/79 emulation adapter.

The IBM *Advanced* 3278/79 Emulation Adapter lets you connect your IBM PC to a System/4300/3081/3083/3090. But that's only the start of it.

The Adapter card has been made smaller to fit a short slot, the price has been reduced to \$595*, the IBM PC memory requirement begins at under 21 Kb, and the Adapter's emulation software is now an expanded family of software with some remarkable new abilities.

- It's smarter. The emulation software can let your IBM PC act

as the mainframe gateway for an IBM PC Local Area Network.

- It's faster. Now you can transfer files up to 40% faster.
- It's more flexible. Now you can redefine the keyboard. Plus, you have the choice of printing on a 3270 Control Unit printer or on a variety of IBM and non-IBM PC printers. (You can even print out data from a host session on your PC printer while you're looking at data from a separate host session on your PC monitor.)
- It's expandable. When you're ready for more emulation functions, you simply move up within the family to a higher level of the emulation software.
- And it lets you do more, a lot more. Including electronic mail, document distribution, and other functions available with IBM's office applications.

For the rest of the story, contact your IBM marketing representative. Or see your local authorized IBM dealer.

IBM

TODAY, a computer company requires
brainpower large enough to
match the size of its customers' needs.

It has to create product lines from
micros to mainframes. Powerful. Compatible.
Upgradable. And affordable.

It has to design software as vast as the
imagination. Software that not only solves
problems, but anticipates them as well.

It has to engineer telecommunications
and networks that link people, applications,
and data bases. Around the office. Around
the world.

It has to commit enormous resources to
research and development.

As separate entities, Sperry Corporation
and Burroughs Corporation have long been
leaders in the technology of Information
Management.

Together as Unisys, that leadership
is bound to grow to new heights. Which
shows the power of a company that puts its
mind to it.

The power of ²

BrainPower²

NEW PRODUCTS/MICROCOMPUTERS

Autodesk, Inc. has announced **Autosketch**, a precision drawing package for IBM Personal Computers.

Autosketch is said to offer text placement, editing, automatic linear dimensioning and scaling capabilities as well as a variety of drawing aids. It utilizes a mouse and pull-down menus.

According to the vendor, drawings can be stored for use in other diagrams or can be converted into DXF format and entered into Autocad Version 2.5.

Graphic options include a Hercules Computer Technology, Inc. Graphics Card, IBM Enhanced Graphics Display or IBM Color Graphics Adapter operating in monochrome mode.

Autosketch is priced at \$79.95.

Autodesk, 2320 Marinship Way, Sausalito, Calif. 94965.

Structural Management Systems, Inc. has announced the **Parameter Manager**, a desktop analysis product for the Apple Computer, Inc. Macintosh.

The software is said to allow users to collect, store, analyze and report the condition of time-, date- or sample-based data. It can trend, forecast and compare data using built-in functions. The data base can contain any number of items, and each item can have up to 64 variables.

Parameter Manager costs \$495. **Structural Management Systems**, 661 River Oaks Pkwy., San Jose, Calif. 95134.

Software utilities

Dynapro Systems, Inc. has announced **Chronos**, a real-time multitasking operating system for the IBM

Personal Computer XT and AT.

Chronos, written in assembly, is said to include an on-line symbolic debugger; a re-entrant window manager for viewing up to 64 tasks at once; device drivers for keyboard, sound generator, parallel printer, serial printer, remote console, touch-screen and mouse; language interface for assembler, C and Fortran; and kernel with 57 system services.

Chronos is priced at \$1,995. **Dynapro Systems**, 1000-1200 W. 73rd Ave., Vancouver, B.C., Canada V6P6G5.

Ken Orr & Associates, Inc. has announced **Brackets**, an interactive diagramming system for the automatic generation of its Warner/Orr diagrams.

Brackets runs on IBM Personal Computers and compatibles. Diagramming functions include creating Warner/Orr diagrams; hiding and showing sets; modifying diagrams; saving, loading, and printing files; and generating ANSI-standard Cobol processor code.

Brackets costs \$695. **Ken Orr & Associates**, 1725 Gage Blvd., Topeka, Kan. 66604.

COMMUNICATIONS

Software

Cleo Software has ported its **8780 Plus Unix**-to-mainframe communications software to the IBM RT Personal Computer.

The software is said to enable the RT's AIX operating system to talk directly to mainframe computers via 2780 or 3780 Binary Synchronous Control protocols.

3780 Plus for the IBM RT costs \$1,195, including the software Syncable and user's manual. Optional 201 and 208 autodial modems are also available.

Cleo Software, 1639 N. Alpine Road, Rockford, Ill. 61107.

Winterhalter, Inc. has announced **Datsynac 3270**, an IBM 3270 emulation product.

The product is said to combine the vendor's **Datasketch 3270 Systems Network Architecture** software with the **Universal Data Systems, Inc. Sync-on** modem board. The **Datsynac 3270** features a menu-driven interface for autodialing, 30 multiple sessions and high-speed file transfer for communications management system.

The **Datsynac 3270** costs \$1,595 for 2,400 bit/sec. data transfer and \$2,195 for 4.8K bit/sec. transfer.

Winterhalter, 3853 Research Park Drive, Ann Arbor, Mich. 48104.

Tekelec has announced the **TES81C MUXdem**, an option for its **TES20A Frame Simulator/Analyzer**.

The **MUXdem** is said to allow users to analyze T1C data by demultiplexing a T1C line into two T1 lines and multiplexing two T1 lines into a T1C line. The option simulates and analyzes bipolar violations and allows testing of live data from telecommunications equipment.

The stand-alone unit has its own power supply. It is priced at \$4,250.

Tekelec, 26540 Agoura Road, Calabasas, Calif. 91302.

Racal-Vadic, Inc. has introduced the **VA4891** synchronous 4.8K bit/sec. rack-mount modem.

The modem was designed for use with the vendor's MD6-II network management system in two-wire dial-up or four-wire leased-line applications, according to the vendor.

It is AT&T 20S and V.27 compatible, provides synchronous autodialing and utilizes the capabilities of the MD6-II system controller, including monitoring and reporting of telephone line impairments.

The **VA4891** modem is priced at \$1,395.

Racal-Vadic, 1525 McCarthy Blvd., Milpitas, Calif. 95035.

Ethernet on Broadband. Today.

Your commitment to the flexibility of Broadband doesn't have to rule out the speed of Ethernet. Chipcom gives you both, with an entire family of products that put Ethernet on Broadband.

Chipcom's Ethernet™ lets you link previously separate environments: Engineering CAD/CAM and MAP... DECnet™ on CATV wiring... as well as high speed host-to-host communications on terminal networks. Capitalize on the strengths of both technologies... without having to choose between either.

Ask Chipcom about Ethernet on Broadband. Call (617) 890-8844 and ask for Mary Stewart, or write: Chipcom Corp., 195 Bear Hill Rd., Waltham, MA 02154. Telex 928-338.

New or Current Subscribers

Celebrate Computerworld's 1000th Issue! Take advantage of our special low price—and get a free commemorative mug! Hurry, offer ends December 5!

Start or extend your subscription to Computerworld, the newswweekly for the computer community, now in our 19th exciting year! There's never been a better time to save! Here's what you get:

All during November, we're celebrating Computerworld's 1000th issue with very special savings for you! Whether you're a new subscriber or a current one, you can get a whole year of Computerworld for just \$35 — that's \$9 off our basic subscription rate! It's our low one-time celebration price!

Why the big celebration? Because for over 19 years, Computerworld has been the computer community's most respected publication. And that's something we're proud of! And something you benefit from!

For you, it means you get the best MIS news around, each and every week. You benefit from our unique fact-gathering capabilities: full-time news bureaus in 4 key regions of the U.S., foreign bureaus in Paris and Tokyo, plus a worldwide network of 400 editors and reporters in over 25 different countries. Nobody else even comes close!

It means news that's timely. News that's accurate. News you can use. No matter what your function. No matter what your responsibility. No matter what your experience level. Get Computerworld now. And get the news you need. Plus...

12 Bonus Issues As part of your Computerworld subscription, you'll get 12 issues of Computerworld Focus at no additional charge. Comprehensive and timely, Computerworld Focus gives you the most up-to-date information on the hottest topics in the field. Software. Connectivity. Communications. And more. All as a bonus — with your Computerworld subscription!

Free Magic Mug Subscribe today, and you won't go away empty handed! You'll get our special commemorative mug free — with your paid subscription to Computerworld. It features a secret "magic message" when you fill it with a hot liquid! And it's yours as our gift when you subscribe or renew today.

Special one-time low price Act now! Our special low rate of \$35 for 1 year (51 issues) is available only through December 5, 1986. So order today — either a new subscription or a renewal of your current subscription. As always, your complete satisfaction is guaranteed, or we'll refund your money on all unmailed issues — no questions asked.

THE NEWSWEEKLY OF THE COMPUTER COMMUNITY

NEW PRODUCTS/SYSTEMS & PERIPHERALS

SYSTEMS
& PERIPHERALS

Turnkey systems

Image Management Systems, Inc. has announced the Office Archiver 2000, an archival system for Wang Laboratories, Inc. VS users.

The Office Archiver 2000 is said to use laser optical disk technology and applications software to enable the user to store up to 1G byte of word processing or data processing information on a laser disk without involving a dedicated I/O processor disk drive port.

The system connects to a Wang VS via a standard Wang workstation interface. The software is menu driven.

The Office Archiver 2000 system costs \$47,500 and comes complete

with one tabletop or rack-mount front-loading laser drive, laser platter, interface hardware and software.

Image Management Systems, One Richmond Sq., Providence, R.I. 02906.

IMI Systems, Inc. has announced a turnkey version of its Warehouse Management Software (WMS) for the Digital Equipment Corp. Microvax.

The menu-driven Microvax package includes modules that handle shipping, storage, retrieval and replenishment. It provides extensive report generation, quality control and security features and supports bar code scanners as well as printers, laser scanner, radio links, interfaces

to mainframes and portable data entry systems.

The turnkey system including hardware, software installation and support costs \$89,500.

IMI Systems, 1500 Broadway, New York, N.Y. 10036.

Graphics systems

Tektronix, Inc. has added the SF4300 industrial color graphics terminal for manufacturing environments to its 4200 series of terminals.

The terminal is said to feature a sealed keyboard and filtered cooling airflow system for protection from air pollutants, dirt and spills. It also features a bar code reader.

The terminal has a 13-in. screen and provides a pixel resolution of 640 by 480.

It offers 16 displayable colors

from a palette of 64, and system memory is 512K bytes, expandable to 1.5M bytes.

The SF4300 is priced at \$5,495. Tektronix, P.O. Box 15273, Portland, Ore. 97215.

Data storage

Media Systems Technology, Inc. has introduced a cartridge tape duplication system.

The system is said to be able to simultaneously copy up to seven 60M-byte, 1/4-in. streaming tape cartridges. It was designed for standard 1/4-in. cartridges using the QIC-34 recording format.

A typical 60M-byte tape with one file copies in about 12 minutes, and a system with seven tape copiers achieves a throughput of about 35 copies an hour, according to the vendor.

The modular system consists of the Model TC-2560 control unit for \$9,650, including a processor, memory, control software and a master tape drive and from one to four duplicator drive units.

A typical system with four copy drives costs \$36,150.

Media Systems Technology, 16812 Hale Ave., Irvine, Calif. 92714.

Auxiliary equipment

Victory Enterprises Technology, Inc. has enhanced its Victory disk duplication system with a communications link said to enable computers to transfer data from a 3 1/2-, 5 1/4- or 8-in. diskette to another computer, or vice versa.

According to the vendor, the system will read most disk formats and transmit data to a local or remote computer and can receive data from another computer and write it in most disk formats as specified by the operator. Two diskettes with different formats can be sent or received simultaneously.

The system is operated from an attached personal computer or ASCII terminal. It transmits data at 500 to 19.2K bit/sec. via an asynchronous link. Prices start at \$3,620.

Victory Enterprises, Suite B2, 9910 Research Blvd., Austin, Texas 78758.

PRICE REDUCTIONS

Burr-Brown Corp. has announced price reductions for its TM900 Transaction Processors.

The TM900 is said to be an intelligent transaction processing system that can control up to 128 microterminals. It interfaces to a single communications port on the host computer.

Base prices now range from \$3,995 to \$6,795, depending on input configurations.

Burr-Brown, P.O. Box 11400, Tucson, Ariz. 85734.

Zyad, Inc. has announced price reductions for some of its laser printer feeder models.

The Paperjet 400 for the Hewlett-Packard Co. Laserjet and Laserjet Plus and Canon U.S.A. LBP A-1 and A-2 laser printers now costs \$1,495. The DSP-8 feeder for the Wang Laboratories, Inc. LP58 Laser Printer now costs \$1,695.

Zyad, 100 Ford Road, Denville, N.J. 07834.

Now, you can run RPG II programs on IBM PCs for only \$750. Bye bye, BABY.

Introducing the Lattice RPG II Compiler for the IBM PC. The new RPG II Compiler is compatible with IBM System III, System/34 and /36. It uses EBCDIC or ASCII files and MS-DOS command language, and has indexed file compatibility with dBase III. And it supports the standard PC keyboard and function keys.

Result: With the RPG II Compiler, you can run or develop RPG II programs on an IBM PC, even if you've never operated a PC before.

What's more, Lattice's new compiler costs only \$750—much less than similar systems. And there are no run-time royalties. So your first cost is your last.

Try the new Lattice RPG II Compiler. When you compare the price and compare the performance, you'll see why it makes other RPG II compilers cry with envy.

The bigger they come, the harder you fall.

Good news: Sorbus® now services the big IBM® 308X series.*
So you can enjoy all kinds of power, without enduring all kinds of trouble.

It only makes sense. We already maintain more IBM equipment than anyone but IBM. And we do it so well that a recent reader survey by *Data Communications* judged us the "Best Service Organization." Period. (Our price/performance ratio had been the best for years anyhow.)

And now our two-hour average response time, our 230,000 part-number inventory, and our quality on-site service are all available for your 308X. And for just about any peripheral you might have connected to it, including StorageTek™ hardware.

The bigger your mainframe, the more you need Sorbus.
Call today. 1-800-FOR-INFO.

If the space program had advanced as fast as the computer industry, this might be the view from your office.

And space stations, Martian colonies, and interstellar probes might already be commonplace. Does that sound outlandish? Think about these facts in mind:

In 1946, ENIAC, the first computer, weighed 30 tons, stood two stories high, occupied 15,000 square feet, and cost \$166,840.22 in 1946 dollars. Today a \$2,000 portable can add and subtract more than 20 times faster. And, by 1990, the average digital watch will have as much computing power as ENIAC.

The collective brainpower of computers sold in the next two years will equal that of all computers sold from the beginning to now. Four years from now it will have doubled again.

It's hard to remember that this is a scientific fact, not fiction. How do people keep pace with

change like this? That's where we come in. We're CW Communications, Inc., the world's largest computer news and information publishers and magazines.

Every month we publish a \$2.00 CIO magazine

for computer executives, and a \$2.00 CIO magazine

for computer executives, and a \$2.00 CIO magazine

nobody covers as many markets. In the U.S. we publish five computer magazines monthly.

At CW Communications, Inc., we're the only computer news and information publishers and magazines

for computer executives, and a \$2.00 CIO magazine

for computer executives, and a \$2.00 CIO magazine

responsible for networking and all other

of data, voice, and video.

InfoWorld is the PC magazine for people managing and purchasing computers.

For American business, CW Communications, Inc. is the only computer news and information publishers and magazines

ness publication of any kind in this country. Our newest publication is *Digital News*, a newspaper published every other week (except August and December) for users of the DEC VAX®.

We also offer six personal computer publications which concentrate on specific personal computers: *PC World*, the comprehensive guide to IBM personal computers and compatibles; *inCider*, the Apple II journal; *Macworld*, the Macintosh magazine; *80 Micro*, the magazine for TRS-80 users; *RUN*, the Commodore C-128/C-64 home computing guide; and *AmigaWorld*, the magazine for the Commodore Amiga.

And we have similar publications in every major computer market in the world. Our network publishes over 70 computer publications in more than 25 countries — Argentina, Australia, Austria, Brazil, Chile, Denmark, Finland, France, Greece, Hungary,

India, Israel, Italy, Japan, Mexico, The Netherlands, Norway, People's Republic of China, Saudi Arabia, Singapore, South Korea, Spain, Sweden, Switzerland, United Kingdom, United States, Venezuela, and West Germany.

The sooner we hear from you,
the sooner you'll hear from our readers.

Simply put, we make it easy for you to reach your target audience — and for them to reach you. Call today for more information. You'll find the number below.

Comshare's journey from time sharing to software pays off

Rebounds by carving DSS niche, reorienting

By Clinton Wilder

ANN ARBOR, Mich. — In an industry in which technology changes quickly and user needs change even faster, a software and services vendor faces a major challenge to change accordingly. Comshare, Inc. is trying to meet that challenge, but it has not been easy.

Founded in 1966 as a computer time-sharing provider, Comshare was just in time to cash in on the time-share bonanza of the 1970s. When that market evaporated as more large corporate users brought their data processing in-house, Comshare's fortunes also dried up.

While annual revenue stagnated near \$66 million in the 1980s, profits shrank steadily until Comshare slipped below break-even. Its work force was trimmed from a peak of 1,300 in 1980 to 925, and its bottom line plummeted from a \$4.5 million profit in fiscal 1980 to a \$379,000 loss in 1985.

But by then, Comshare had begun a long-overdue transition to become a completely new entity: a software vendor. In its most recent quarter ended Sept. 30, Comshare's revenue from software products and profes-

sional services surpassed its time-sharing revenue for the first time.

"I had been waiting for four years for that to happen," says Richard Crandall, Comshare's founder, president and chief executive officer. Comshare's profit of \$502,500, or 18 cents per share, during the quarter puts it well on the way in fiscal 1987 to exceeding earnings of \$1.3 million, or 48 cents per share, in the fiscal year ended June 30, 1986.

Comshare has made the transition back to profitability with a time-honored formula: carving out a niche. Comshare's concept is one of executive workstation software, which includes a decision-support system (DSS), System W, and a 1-year-old executive information system (EIS), Commander. Both run under IBM MVS and VM with links to the IBM Personal Computer AT or XT. Although Comshare had been in the computer business for some 15 years, the development and marketing of System W in the early 1980s required nothing less than a complete reorientation of the company.

"If we were going to bust into the

software business, we couldn't do it with a me-too offering of our own time-share applications," Crandall says. "We had to learn how to be a software company. That included turning over a lot of our sales force. For years it had been largely consultative, unlike the six-gun sellers we were up against in the software market."

Comshare got what appeared to be a big break in 1984 when it signed a two-year marketing agreement with IBM. Although IBM did not sell System W directly, the pact permitted Comshare and IBM sales representatives to make calls together.

"It was very healthy for Comshare in terms of market awareness, and we learned a lot about hooking into the SQL and DB2 worlds," Crandall says.

Some observers, however, contend that results from the IBM deal fell short of Comshare's expectations. Tom Lawton, publisher of the "Computer Services Report" in Belmont, Mass., says the overall market for DSS products has been disappointing, even with a helping hand from IBM.

"Everyone seemed to think that

executives will sit there pushing buttons, but it's a tough sell," Lawton says. "Comshare was one of the many victims of the IBM mystique, thinking the agreement would do an awful lot for them. But the whole decision-support market is not bearing the fruit that the forecasts expected."

Comshare remains confident, however, seeking an edge for increasingly user-friendly EIS software. "Executives don't want to read documentation, learn command sequences, spend more than five minutes training or use a mouse," Crandall says. "The system has to be about as easy to use as a stove."

Comshare hopes to enhance its microcomputer connections through an agreement with its newest partner, Ashton-Tate (CV, Aug. 4). The firms are jointly marketing a version of Comshare's W/Information Gateway micro-to-mainframe link that allows file exchange between System W and Ashton-Tate's dBase series.

"To us, the PC is a business professional's workstation," Crandall says. "By and large, mainframe software vendors have been terrible at tapping the micro software market. Now we're trying to catch the second wave. As the market begins to realize that PCs have to get at the mainframe data, you'll see a shift back to the mainframe providers."

Comshare's Crandall

REACH OVER 40,000 COMPUTER PROFESSIONALS IN SWEDEN.

Your ad in CW Communications' Swedish publications will introduce your products to computer professionals in Sweden where total R&D expenditures for 1985 reached \$32 billion.

Computer Sweden, the only weekly computer magazine in Sweden, reaches 15,000 MIS/DP professionals. Svenska PC World is the magazine 7,000 IBM PC users rely on six times a year for timely information on program reviews, user reports, new products, tests and recommendations.

MikroDatorn is the monthly magazine that reaches 18,000 business/professional and home/hobby micro users with up-to-date industry information.

OPC Nyheter is CW Communications' newest publication in the Swedish market. This monthly magazine reaches PC and microcomputer users.

CW International Marketing Services makes advertising your products in Sweden, and around the world, easy. We have over 55 publications in more than 25 countries. For more information on our wide range of services, complete the coupon below and mail today.

Dean F. Redfern
Age: 32
VP/Information Services
McCormack & Dodge
Annual Budget: \$14.7 million
Road Racer

The influence of Information Services is beginning to extend well beyond the traditional boundaries of the computer room. Today's IS department is developing strategies for networking. Installing telecommunications. And busy adding micros in virtually every corporate department.

With a future so promising and dynamic, it's no wonder up-and-comers like Dean Redfern find Information Services so attractive.

Dean has always had the inside track in the world of computers. The son of a DP manager, he began programming in COBOL and Fortran at the age of 12. At 23, McCormack & Dodge, Dun & Bradstreet's software development company, hired him from his formal training at Hardtford's Computer Processing Institute before he could even finish.

His philosophy was quite simple, even in his earliest days. Not one to live by others' rules, he vowed to employ any tactic, embrace any product, use any technology, as long as it got the job done.

Several years ago, for instance, he was forced to move his entire IS/DP department across town. IBM told him the job would require at least a week of downtime. And that was all the challenge Dean needed. He rented rooms for his staff for a weekend at a nearby hotel, and accomplished the task between business hours Friday to Monday. Every one of his 700 terminals was up and productive Monday morning.

In 1984, Dean designed and implemented a nationwide SNA network so all 12 U.S. offices could demonstrate McCormack & Dodge's main-frame software on site. That move contributed significantly to a 50% revenue growth in the following year.

Today, Dean is responsible for a staff of 150, and a budget of nearly \$15 million a year—a good part of which goes to purchase the 300 micros (and attendant peripherals) he installs every year. And he reports directly to the CEO.

Dean is also an avid road racer—he runs some 60 miles a week—an active member of the BMW Car Club of America, and a world traveler.

As you can imagine, Dean's a busy man. But if you really want to reach him, you can.

In Computerworld.

He's been reading it since he was 15 when he had to borrow his father's issue. And he reads it cover-to-cover, with his first cup of coffee. He claims it's helped him see the whole information services picture. Get a more global perspective. Spot the trends early and make the right decisions.

As young and accomplished as Dean is, he's by no means alone in his success. Information Services is a young industry. Full of individuals with individual visions. Yet they all seem to have one common insight.

Their favorite newspaper:
Computerworld.

Bomb rocks German IBM research center

By Amiel Kornei

HEIDELBERG, West Germany — Terrorists exploded a bomb in the early morning of Sunday, Nov. 16 at IBM's European Networking Center here, causing no injuries but shattering windows and damaging a mainframe computer.

The Red Army Faction claimed responsibility for the attack in an eight-page letter left at the front of the building.

The letter denounced IBM's cooperation with West German universities as well as the firm's role as a major economic force in the country, according to an IBM spokeswoman in

Stuttgart, West Germany.

"It could have happened to Siemens AG or anybody else," she asserted, adding, however, that "they were well informed about what goes on at the Heidelberg center."

The center, created in July 1985, is a focal point for IBM development work related to the International Standards Organization's Open Systems Interconnect standards.

The bomb, which exploded at 4 a.m., caused at least \$1.47 million in damages, according to a spokesman at the West German Federal Attorney General's office. Part of the center's mainframe was hit, the IBM spokes-

woman said, adding, "But it still works."

Two local priests received warning phone calls, permitting evacuation of the IBM premises before the explosion. The building, located in a residential neighborhood, has only minimal security.

The attack was the most recent in a series targeting West German computing centers and research facilities.

Kornei is European bureau chief for the CW Communications International News Service.

IBM opens chip plant in France

CORREIL-ESSONNES, France — IBM France recently inaugurated a 45,000-square-meter chip manufacturing facility here.

However, IBM officials privately expressed their disappointment that the French government did not use the occasion of the opening to give its go-ahead to the computer giant's plans to offer a value-added telecommunications service.

The network project is being conducted in conjunction with software and services group Sema-Matra and investment bank Paribas.

Competition

The project faces competition from a rival venture led by Ing. C. Olivetti & Co., the Italian office equipment giant.

The \$375 million Corbeil-Essonnes plant will produce bipolar semiconductors for use in IBM's 3090 mainframe series.

IBM Chairman John Akers billed the plant as "the factory of the future."

Akers added that the investment would last 30 years and reported that start-up is planned for the first quarter of 1987.

Pansophic's acquisition binge continues

By Clinton Wilder

OAK BROOK, Ill. — Continuing its flurry of acquisitions, Pansophic Systems, Inc. recently announced its intent to purchase a developer of IBM System/38 software applications and the graphics division of a vendor of turnkey, computer-aided slide-making systems.

The acquisitions will continue Pansophic's diversification away from the IBM mainframe-based systems software market.

Pansophic will pay \$19 million in cash for Professional Computer Ser-

vices, Inc. (PCR), an 11-year-old, privately held vendor of System/38 applications based in neighboring Oak Brook Terrace, Ill.

PCR's product line includes manufacturing, distribution, accounting and personnel programs.

Separately, Pansophic also agreed to pay approximately \$2.5 million for the graphics division of AVL, Inc. of Tinton Falls, N.J. Pansophic will acquire AVL's Starburst+, an IBM Personal Computer AT-based system that creates color slides integrating text, images and graphics. AVL is an

authorized IBM value-added dealer.

PCR and the AVL division mark Pansophic's third and fourth acquisitions in recent weeks. Pansophic has also purchased SPSS, Inc., a Chicago-based developer of statistical software applications, and Fusion Products International, Inc. of San Rafael, Calif.

Fusion Products markets System/36 and 38 utilities similar to Pansophic's mainframe offerings, including retrieval, report writing, data dictionary, query and a microcomputer link.

PC TELECOMMUNICATIONS FROM A COMP

It's just what you'd expect from just who you'd imagine.

AT&T, the pioneer in data transmission, now puts its technological expertise to work on data transmission between PCs. With a family of low-cost modems for virtually every personal computer, computer terminal and printer in use today.

Now, you and your PC can communicate with a friend's PC across the country. With your company's mainframe in the home office. Or with the printer down the hall. You can tap in-

to one of the growing number of subscription data services or handle your banking from home. All with the reliability you've grown up expecting from AT&T.

The AT&T Model 4000 is a desktop modem designed for the AT&T PC 6300, all IBM*-compatible PCs, and most asynchronous terminals and printers. It sends and receives data over standard telephone lines at speeds of 300 and 1200 bps.

The AT&T Model 4112 does everything the 4000 does.

The AT&T Model 4000

EXECUTIVE CORNER

Alvar Green has been elected president and chief executive officer of Autodesk, Inc. He joined Autodesk in 1984 as chief financial officer. Green succeeds John Walker, who will remain chairman of the board and continue as a full-time employee engaged in product design development and planning. Daniel Drake, co-founder, vice-president and director of the company, will assist Green in the administration of the company.

John Donnelly has been appointed president and chief executive officer of Concord Data Systems, Inc. in Marlboro, Mass. Donnelly succeeds C. Kenneth Miller, the company's chairman and chief technical advisor as well as chairman of Concord Communications, a sister company of Concord Data Systems.

Mohawk Data Sciences Corp. has named Karl H. Niemi president and chief operating officer of the company's MDS Qantel subsidiary. Niemi has served as chief operating officer of Qantel since July 1986. Prior to that, he served as vice-president of Mohawk Data Sciences Corp.

Gould, Inc. has elected President and Chief Executive Officer James F. McDonald to the additional position of chairman and elected William

F. Glavin, vice-president of Xerox Corp., to the company's board.

Julius M. Dziak has been promoted to president and chief operating officer of Endata, Inc., based in Nashville. Dziak joined Endata in 1979 when his firm, Alpha Data Sciences, Inc. was acquired by Endata. He served as executive vice-president of the corporation and chief operating officer of the Data Imaging Division.

Jacob S. Vigil has joined MIPS Computer Systems in Sunnyvale, Calif., as senior vice-president of engineering and manufacturing. Vigil came to MIPS from Hewlett-Packard Co., where he was the manager of systems management operation in the information technology group.

Nastec Corp. in Southfield, Mich., announced the appointment of Martin Sprinzen as president and CEO of the company. Sprinzen previously served as vice-president of engineering at Relational Technology, Inc.

Edward L. Marinare has been promoted to chief executive officer of Western Digital Corp. in Irvine, Calif. As CEO, he will be responsible for Western Digital's manufacturing, engineering and marketing functions. Prior to his promotion, Marinare served as executive vice-president of the company.

Cullinet Software, Inc. announced the appointment of Roger A. Dorf to the position of vice-president of ex-

tended support services. Dorf joins Cullinet from BOLIUM Corp., where he was vice-president of operations.

David M. Weishaar has been appointed executive vice-president and chief operating officer of Sequoia Systems, Inc., in Marlboro, Mass. Weishaar was vice-president of manufacturing at the company.

Perfect Data Corp. in Chatsworth, Calif., announced the appointment of Lee R. Mannheim as president and chief executive officer of the company. Mannheim came to Perfect Data from Vivitar Computer Products, where he served as vice-president and general manager.

Howard Haythornthwaite has been named senior vice-president of Cullinet Software, Inc.'s Asia/Pacific Operations in Singapore. Previously, he served as vice-president of international manufacturing operations at Data General Corp. in Hong Kong.

Apple Computer, Inc. announced the promotion of Lawrence G. Teaser to the newly created position of vice-president of advanced technology. His responsibilities will include investigating technologies and standards that will be of value to Apple in future product development.

Arvay Finegold has been appointed president and chief executive officer of Hunter & Resdy, Inc. in Palo Alto, Calif. Finegold was former president and CEO of Daisy Systems Corp. in Mountain View, Calif.

Alliant files with SEC for public offering

By Stanley Gibson

LITTLETON, Mass. — Alliant Computer Systems Corp. recently announced that it has filed a registration with the Securities and Exchange Commission for an initial public offering of 1.5 million shares of its common stock.

A U.S. offering of 1.2 million shares will be underwritten by a syndicate headed by Morgan Stanley & Co., Inc. and Hambrecht & Quist. The remaining 300,000 shares will be sold internationally by the same corporations. The initial offering price is estimated to be between \$19.50 and \$18.50 per share.

Alliant manufactures the FX series of parallel processing minisupercomputers used for engineering and scientific applications. Alliant sells its computers both directly and through a joint marketing agreement with Apollo Computer, Inc. To date, Alliant has sold a total of 54 units.

Alliant first attained a profit in the fourth quarter of 1985 and, through the third quarter of fiscal year 1986, has earned \$2.4 million in profits, including an extraordinary tax credit of \$600,000 on sales of \$18.5 million.

ANY THAT NEEDS NO INTRODUCTION.

Except sit on your desk. The 4112 is a modern on a half-card installed in an expansion slot inside your PC.

The AT&T Model 4024 is a desktop unit that communicates synchronously and asynchronously with PCs, terminals and printers, at speeds up to 2400 bps.

All are backed by a two-year warranty and with a 24-hour toll-free hotline.

But what if you don't know synchronous from asynchronous? Or bps from rpm? Which AT&T modem is for you? That's where your authorized AT&T dealer

comes in. Your dealer can help you make the right choice, as well as demonstrate the AT&T software to make it work.

For the name of the AT&T dealer nearest you, call 1 800 247-1212, Ext. 240.

Then stop by, and ask for AT&T modems by name.

Software prices rising up curve

From page 102

press (CW, Oct. 20). The just-announced DOS-to-MVS/XA migration aids will also help.

When the XA Express train stops, however, some 4381 users may discover they are paying an order of magnitude more for their software than did the top-of-the-line mid-size users six years ago. During a three-year period, the 4381 users will have spent more than one-third — 37% — of their total operating costs on systems software. Measured by the 4381 yardsticks, the 370% increase in systems software costs during the same period for the largest IBM users

pales by comparison.

The above intermediate systems example, however, gives the 3090-class users a glimpse of what may await them in the future as IBM

expands its new graduated software pricing scheme beyond the intermediate systems market. Two years ago, it was apparent that IBM may have to engage in some creative pricing for its software to realize its business objectives.

The reasoning at that time was based on a fundamental change taking place in the way the large systems were being built.

The IBM 3090s and MVS/XA

marked the beginning of a new era in the industry: the era of "multi-engines." When IBM started shipping the 3090-4s and MVS/XA in 1983, this "quad" system marked the first

time that the multi-processor concept was being stretched beyond just the two CPUs working together.

What are the consequences of such a trend? As a result of the new multiengine environment, the number of large systems will stay virtually flat, and even go

down slightly from current levels, although the installed million-instructions-per-second capacity will show a healthy growth through

1991. Therefore, as long as the software charges are tied to CPUs, IBM's software revenue can only grow through straight price increases. And that by itself is simply not enough to meet IBM's business objectives.

Considering that the systems software represents only about 8% of an IBM 3090 customer's three-year operating costs, as opposed to 37% for the 4381s, one can see that the large users' spending is now at about the point of IBM's top intermediate customers' spending in 1980.

IBM's software price hikes for large systems will have a long way to go. And that means that large IBM users "ain't seen nothing yet" — to borrow an expression straight from the bullpen. They had better gear up for a long, steep climb up the IBM software pricing curve.

99
The number of large systems will stay virtually flat — even go down slightly from current levels.

"One phone call...and I can place my clients' advertising in virtually any computer market in the world."

Ellen Freeman is president of Freeman Associates, a media planning and buying service for high-tech advertisers. With 11 years of agency experience, Ellen is one of a handful of people who understands how to plan media for high-tech companies. She has been involved with international as well as domestic programs, and she has definite opinions about the services of CW Communications.

Ellen explains, "High-tech companies generally don't have the information they need to evaluate international markets. But CW International Marketing Services makes it easy to explore foreign markets by offering in-depth marketing knowledge and expertise."

Ellen recognizes the frustration of media buyers when considering foreign media. She says, "There are so many factors involved — time and language differences, commission structures, exchange rates, taxes, transmission, mechanical specs. Billing alone is a nightmare." She adds, "But CW offers the single-vendor solution. One phone call to a local rep, and I can place my clients' advertising in virtually any computer market in the world."

She continues, "There is a definite lack of research available on foreign publications in comparison to the volume of circulation and readership information provided by U.S. publications." However, Ellen trusts CW International Marketing Services to help her make media choices. She explains, "CW brings more information to the table than any company I've dealt with. No one else makes international buying as easy."

Ellen sums it up, "There are too many things U.S. media buyers take for granted. Buyers generally don't even know the right questions to ask when dealing abroad. CW helps us plan and buy media in multiple countries — all in one American package, eliminating costly errors."

To find out how CW International Marketing Services can help you, call Frank Cutitta, Managing Director, toll-free at 800-343-6474 (in MA, 617-879-0700).

Japan directs vendors to honor U.S. trade pact

By Clinton Wilder

Amid widespread charges of continued dumping by Japanese semiconductor vendors, Japan's Ministry of International Trade and Industry (MITI) agreed last week to demand that Japan's 10 largest chip makers stop the practice.

U.S. trade officials had warned recently that they would reimpose duties and fines against the Japanese firms if they continued to sell chips below cost in markets other than the U.S. and Japan. The so-called third-country dumping violates last summer's U.S.-Japan semiconductor trade agreement, which U.S. officials threatened to cancel if the dumping does not end by early December.

MITI has no formal control to regulate prices charged by Japanese vendors but is considered a powerful voice in Japanese trade practices. U.S. and Japanese officials said they may be able to determine the vendors' compliance with the MITI request as early as this week.

Before the MITI announcement, the U.S. Semiconductor Industry Association formally urged the U.S. government to immediately impose unspecified sanctions against Japanese firms violating the agreement by dumping.

Toshiba, Motorola to offer superchips

From page 102

nounced plans last week to enter full-scale production of application-specific integrated circuits in Durham, N.C. some time in 1987. Mitsubishi is said to have earmarked an estimated \$12.4 million for the Durham facility.

According to Mitsubishi, the firm chose the U.S. production site to stem growing export profitability incurred by the strong Japanese yen in value against the U.S. dollar.

"When it comes to reaching data communications professionals, Computerworld leads the way."

Edward P. Dimlingo
Director Corporate
Communications
Intelon Systems
Cherry Hill, NJ

Intelon Systems is a manufacturer of statistical and time-division multiplexers, network concentrators, intelligent switching systems, and network management systems. To Ed Dimlingo, Director of Corporate Communications, it's important for Intelon to have high visibility among data communications professionals. So when Intelon introduced its newest product, the InfoStream™ 1500 T1 voice and data multiplexer, he chose Computerworld as the major vehicle for getting the message to the right people — network managers, voice and data managers, and MIS/DP directors.

Ed explains just how he knows their message is being read. "I put together a list of data communications buyers and influencers. And for the past two years, I've polled these people to find out what they read most. Computerworld always leads the way. In fact, in the most recent study, Computerworld came in way above the others at 65%, with Dataamation at 51% and Data Communications at 23%."

In fact, Ed's own readership studies were reinforced by results of a recent Starch study. "Our InfoStream ad ranked in the top 10 percentile for 'read most' among all advertise-

ments studied in the issue. There's a real need for T1 information in the communications field among Computerworld's readers, and our message got to these people."

Computerworld. We're helping more suppliers reach more buyers more often. We cover the entire computer market. Every week. We deliver the news, the analysis, and the audience. Just ask Ed Dimlingo. Call your Computerworld representative for all the facts. Or call Ed Marecki, Vice President/Sales, at (617) 679-0700.

InfoStream is a registered trademark of Intelon Systems Corporation.

ROCKETS
AND DORIES

Boole and Babbage, Inc. announced revenue for the year ended Sept. 30 of \$9.4 million, compared with \$7.9 million a year ago. Net income was \$1.3 million, or 40 cents per share, compared with a loss of \$6 million, or \$1.99 per share, in the previous year. For the fourth

quarter, revenue was \$9.4 million, compared with \$7.9 million one year ago.

VM Software, Inc. reported revenue for the third quarter ended Sept. 30 of \$6 million, compared with \$4.3 million in the previous year. Profits were \$844,721, or 20 cents per share, compared with \$658,988, or 16 cents per share, in the like period a year ago.

Autodesk, Inc. announced

preliminary results for its third quarter ended Oct. 31 of revenue of \$13.6 million and net income of \$3 million, or 43 cents per share. In the like quarter a year ago, Autodesk earned \$1.8 million, or 26 cents per share, on revenue of \$7.7 million.

Commodore International Ltd. announced revenue for the first quarter ended Sept. 30 of \$176 million, compared with \$159.2 million a year ago. Net income was

\$3.7 million, or 12 cents per share, compared with a loss of \$39.2 million a year ago.

Paradyne Corp. showed no signs of emerging from its prolonged slump, reporting a net loss for the third quarter of \$13.6 million, compared with a net loss a year earlier of \$6.3 million. Revenues were \$64.2 million, up slightly from \$57.8 million in the third quarter of 1985.

Centronics Data Comput-

er Corp. announced revenue for the third quarter ended Sept. 28 of \$38 million, compared with \$50.3 million a year ago. Profits were \$206,000, or 1 cent per share, compared with \$632,000, or 5 cents per share, in the like quarter a year ago.

Telerte, Inc. announced revenue for the third quarter ended Sept. 30 of \$61 million, compared with \$41.8 million last year. Profits were \$11.1 million, or 25 cents per share, compared with \$8.3 million, or 19 cents per share, in the like quarter last year.

For the year, revenue was \$210.4 million, a 42% increase over the \$148.5 million reported in the prior year. Net income for the year rose 16% to \$38.5 million, or 87 cents per share, from \$33.4 million, or 75 cents per share, in the previous year.

The Ultimate Corp. reported revenue for the second quarter ended October 31 of \$42.9 million, compared with \$34.2 million last year. Profits were \$3 million, or 31 cents per share, compared with \$3.3 million, or 40 cents per share, in the comparable period a year ago.

Emulex Corp. said increased demand and margins for new storage controllers contributed to a 9% increase in first-fiscal-quarter earnings to \$1.5 million, or 12 cents a share. Revenue showed a marginal increase to \$25 million, the Costa Mesa, Calif.-based firm reported.

West Systems, Inc. reported revenue for its second quarter ended Sept. 28 of \$8.3 million, down 26% from the \$11.2 million reported for the like period one year ago. Net loss for the quarter was \$1.6 million, or 7.6 cents per share, compared with the second-quarter net income one year ago of \$213,000, or 1 cent per share.

"Everyone's reading Computerworld."

Marc Sokol
Vice President
REALIA, Inc.
Chicago, IL

REALIA, Inc. manufactures REALIA COROL, a micro COROL compiler with the capacity, compatibility and speed to move development work — or production systems — from the IBM mainframe to a PC. When Marc Sokol, REALIA's Vice President, wanted MIS/DP directors to know about his compiler product, he chose Computerworld.

Why? Because "... everyone's always reading Computerworld. It's on everyone's desk. Just look around." Marc goes on to say, "Computerworld's my only choice as far as reaching MIS/DP professionals is concerned. They're the ones making the buying decisions in the larger corporations for my compiler product."

Computerworld. We cover the entire computer world. Every week. We deliver the news, the analysis, and the audience. Just ask Marc.

Call your local Computerworld sales representative, or Ed Morecki, Vice President/Sales, at 617 (879) 0700, for all the facts.

Ashton-Tate profits rise

From page 103

Third-quarter earnings per share were 65 cents, compared with 49 cents in the third quarter of 1985. Revenue was \$57.7 million, a 102% increase over the previous year's \$28.6 million. Nine-month earnings were \$147.9 million, compared with \$80 million.

During the third quarter, Ashton-Tate completed its acquisition of Decision Resources, a business graphics software developer, and announced Dbase Mac, a relational database management system for the Apple Computer, Inc. Macintosh.

**Take advantage of

126,000 MIS professionals
will be counting on to meet
the challenge and changes
coming in 1987.**

Computerworld's Forecast '87 Issue

1987 will bring whole new dimensions to information systems. Users are experiencing a virtual transition in technology. And information systems professionals will be responsible for integrating these changes into their organizations.

That's why, on January 5, they'll turn to *Computerworld's* Forecast '87 issue.

In the pages of Forecast '87, these information systems professionals will read articles on important topics like these:

- Future of 386DOS: are there alternatives, like Macintosh?
- Trends in data center, departmental, and end-user computing: how are companies dealing with these levels of computing?
- Relationship between information systems spending and the economy: what can be expected in 1987?
- Outlook of discrete market segments: who's going to be up — and who's going to be down?
- Communication networks management: how do they hope to solve their most pressing problems?
- Increased automation of the applications development process: can AI help?

Reach these key decision makers when you advertise your products and services in *Computerworld's* Forecast '87 issue. You'll deliver your message to these users who need and want to know what to expect during the upcoming year of computer transition. But hurry, the closing date is December 12.

Call Ed Marecki, Vice President/Sales, at (617) 879-0700, or call the *Computerworld* sales office nearest you.

COMPUTERWORLD

COMPUTERWORLD's paid circulation climbed to over 129,522 this fall. Folio 400 (Folio Magazine's study of trade publication performance) placed us first in total revenue. As the industry grows, so will COMPUTERWORLD. It will continue to offer the high quality news coverage and editorial content that has attracted its readers. What does that mean to you, our advertisers? Good news...in the form of wide exposure.

The Classified section of the newspaper is laid out in an attractive format and is easy to read. It offers classifications to solve a variety of problems:

Position Announcements, Buy • Sell • Swap,
Software For Sale, Software Wanted, Time &
Services, Bids & Proposals, Business
Opportunities, Real Estate, Auctions,
Positions Wanted, Seminars & Conferences,
Publications and The Bulletin Board

So, as a nationwide publication, we give you the exposure you want. As a weekly publication, we give you the immediacy your advertisements need.

A number of Executive Reports and Product Spotlights are scheduled to run in COMPUTERWORLD during the first quarter of 1987. Each of these features will focus on one aspect of the computer industry and give our advertisers a chance to reach a more select audience. These are some of the topics the features will cover:

Executive Reports

- Jan 12 - Capacity Planning
- Feb 9 - State-of-the-art data centers
- Mar 9 - Vertical Markets: Banking

Product Spotlights

- Jan 19 - Terminals
- Feb 2 - Networks
- Feb 16 - Micro/mainframe links
- Mar 2 - PC storage devices
- Mar 16 - Graphics
- Mar 30 - Modems

COMPUTERWORLD publishes every Monday with an ad deadline of 10 days prior to each issue date. You may send in copy to be pubeset or camera-ready material (vexat or negative) via the mail. We provide telecopier service and will also take ads over the phone.

**BIDS &
PROPOSALS**

DEPARTMENT
OF SOCIAL SERVICES
ATTENTION: BIDDING DIVISION
MANUFACTURERS AND
THIRD PARTY VENDORS

The New York City Human Resources
Administration Office of Data Processing
is seeking proposals for permanent
acquisition of two leased printers.

At the minimum, these printers must
print 2000 lines per minute, have 132
pins per inch, contain interchangeable
print heads, automatic paper feeder,
user control panel and a continuous
vacuum system. In addition the printer
must be supported by CDP's current
operating system of MVS/SP, as well
as be capable of interfacing to the
future with MVS/SP, MVS/SP or VME/SP.

Proposals will be received by Human
Resources Administration Office of
Data Processing until 5:00 P.M. Friday,
December 12, 1986.

A Preproposal Conference will be held at
10:00 A.M. December 8, 1986 at 111
Eighth Avenue, 8th Floor, N.Y.C.

Requests for Proposals may be obtained
from the HRA Office of Data Processing,
111 Eighth Avenue, N.Y., N.Y.
10011, Attention: Data Proc. Tele-
phone No. (212) 208-3740/3742

EXECUTIVE DIRECTOR
ALABAMA SUPERCOMPUTER
NETWORK AUTHORITY

The Alabama Supercomputer Network Authority, in conjunction with the Department of Planning, is charged with the establishment of a supercomputer center to provide services for the educational, research, and industrial needs of the state. The authority invites proposals and applications for the position of Executive Director. The supercomputer will be physically located in Huntsville, Alabama with associated facilities and telecommunications network with major nodes located throughout the state. The executive director and his or her staff will provide the management and direction of the program and will report directly to the authority.

RESPONSIBILITIES OF THE EXECUTIVE DIRECTOR:

1. To provide leadership and coordination for the facilities vendor.
2. To consult with the community of users and establish procedures necessary for fair and equitable access to the supercomputer.
3. To insure the quality and proficiency of the services provided by the facilities vendor.
4. To provide and execute a marketing plan which insures the best and maximum use of the supercomputer for the development of the State of Alabama.
5. To advise and instruct the facilities vendor regarding acquisition of hardware, software, and any general service enhancement.
6. To serve as the primary representative of the authority in liaison with the executive and legislative branches of state government.

QUALIFICATIONS:

1. An earned master's degree, doctorate preferred.
2. A minimum of ten years of progressive experience in the overall management and/or coordination of high level computing services primarily with supercomputer involvement.
3. Substantial experience in a university and/or organized research environment with a high level of computer use.
4. Proven ability to organize and market services to diverse clients.
5. Demonstrated competence in managing the fiscal affairs of large organizations providing computing services.

Applications or resumes must be received by December 16, 1986. Salary is competitive and negotiable depending upon experience and qualifications. Applications or resumes and requests for information should be directed to:

V. Gordon Minton
Vice President
AD 355
UNIVERSITY OF SOUTH ALABAMA
Mobile, Alabama 36688

The State of Alabama is an Equal Opportunity Employer

DB2 answers skeptics, thrives

From page 1

Competitors say accounts of the move to production systems can be greatly exaggerated. Amex Life Assurance, a division of American Express Co., recently chose Supra, a relational DBMS from Cincom Systems, Inc., instead of DB2.

"We've had very good success when the buyer had a chance to evaluate other products," claims Cincom President Dennis Taborak.

"IBM has put DB2 in a lot of places where they have IMS installed," says John Cullinane, chairman of Cullinane Software, Inc. That just means IMS sites are experiencing "a tremendous amount of confusion" as they try to deal with both. "DB2 is not a very good engine," Cullinane adds.

Officials at other independent software companies say IBM created nearly irresistible pressures on MIS departments when it offered six months free use of DB2 earlier this year.

In many cases, MIS managers assigned one or two programmers to work with it on an experimental basis. At the end of six months, DB2 did not go into production; it went on the shelf, they claim.

Daniel A. Parker, a spokesman for the British Columbia Telephone Co. in Vancouver, B.C., which tried DB2 and backed off, says budget constraints, a shortage of technical staff and "the large amount of work needed on our data before we could implement DB2" forced the retreat.

Arthur Andersen's Mullen says DB2 is being bought by some customers "who have been oversold on its simplicity." When they learn otherwise, the customers abandon the ef-

fort to develop in-house expertise and stop using it, he says.

Nevertheless, a broad band of independent observers see DB2 moving swiftly into DP operational functions.

Industry analyst Scott M. Smith, vice-president of Donaldson, Lukin & Jenrette, Inc., a New York brokerage house, acknowledges that "DB2 is not being used to run the Citibank automatic teller machine network," but he says the people who have bought it "are starting to use it in more serious applications."

Paul Heessinger, a frequent lecturer on DB2, says he knows of 56 to 60 large corporations that are using DB2 in production systems. "A good percentage of the current DB2 user base is moving it into production use or is considering doing so," says the vice-president of research at the Computer Task Group, Inc. in Buffalo, N.Y.

Getting figures to back up these impressions is difficult. Surveys on DB2 use frequently precede the second- and third-quarter period for the year that IBM complementarily offered DB2 for six months. A survey taken at the end of 1985 showed DB2 installed at 450 organizations, but independent observers think the figure has moved far past that point this year. Computer Task Group's Heessinger says IBM's goal is to get 80% of its IMS customers to use DB2 by 1990, narrowing IMS's work load to high-volume tasks.

Many DB2 users say they believe IBM will continue to improve the performance of DB2, and it is this faith that angers IBM's competitors in the DBMS market.

The independents are hurt by IBM's ability to exploit any doubts about their staying power, asserts Martin Goets, senior vice-president and chief technical officer at Applied Data Research, Inc., marketer of the Datacom/DB DBMS. "Will the

company be there to improve the product? Particularly in data base, it's a very tough decision to move away from IBM," he says.

But several spokesmen for the independent companies express doubt that IBM will be able to improve DB2's performance much beyond the February release.

"It's extremely difficult to build performance into a product that doesn't have it to begin with," asserts Stuart Miller, president of Software AG of North America, Inc. in Reston, Va.

Miller says he does not doubt IBM will improve performance somewhat, but he "disbelieves the expectations IBM is building up in people's minds."

The Amex Life Assurance division of American Express cites three factors — DB2's lack of a fourth-generation language, data dictionary and referential integrity — in explaining why it chose Cincom's Supra over DB2.

"To build an integrated product line is incredibly difficult to do," says Cullinane's Cullinane, citing the data dictionary and ADS/Online development language that work with its DBMS, IMS/R.

But the independents themselves are moving quickly to fill much of the void left by IBM by making their established products work with DB2.

In addition, IBM is trying to upgrade its young fourth-generation language, Cross System Product, or CSP. Arthur Andersen's Mullen says customers complain about a very long learning curve with CSP, but they were using it after two weeks. "Still, development tools are not IBM's thing. IMS tools never really became wonderful."

Indeed, it is the analogy to IMS that some observers think is mislead-

ing the skeptics of DB2. When it first came out, IMS was a rough product, difficult to learn and filled with bugs. DB2 "appears to be an overnight success, but it was very carefully groomed. IBM could have released it much sooner," says Edward Knauser, president of Knauser Consulting in New York, a firm that specializes in DB2 applications.

IBM offered DB2 at a time when the market's appetite for relational qualities was blooming, and it released it in such a fashion that the product was unmistakably distinct from IMS. Initially selling a dual data base strategy, IBM educated its customers on DB2 as a relational product without prompting them to try to move all their IMS applications over to it, says analyst Smith of Donaldson, Lukin & Jenrette.

Smith says he initially deplored IBM's dual data base strategy, but now he sees it as "extremely smart." Because DB2 was distinguished from IMS, IBM succeeded in launching DB2 as an independent product. If IBM had named DB2 IMS/II, the new product would have carried the stigma of IMS's many problems," Smith says.

Perhaps even more important, users of DB2, including The Port Authority, are finding unanticipated productivity gains.

"We think we can do applications in less time with DB2," says Arthur Andersen's Mullen. "But we still use the old standards for estimating application development. We are using up all the estimated time on DB2 applications in order to do a better system the first time around."

"There's a productivity gain. It just doesn't show up as a smaller amount of time," she says.

Edward Knauser

Why DB2 can shoulder IMS chores — and then some

IBM's DB2 database management system is widely regarded as the most powerful and flexible relational database management system available today. It is also the most widely used relational database management system in the world. This is because DB2 is a true relational database management system, and it is the only one that can handle the full range of relational database management system functions. It can handle the full range of relational database management system functions, and it is the only one that can handle the full range of relational database management system functions.

For example, The Port Authority of New York and New Jersey, which uses DB2, says it has been able to reduce the amount of time it takes to process a transaction by 50%. This is because DB2 is a true relational database management system, and it is the only one that can handle the full range of relational database management system functions. It can handle the full range of relational database management system functions, and it is the only one that can handle the full range of relational database management system functions.

The system is an open architecture, which means it can be used with a wide variety of hardware and software. It is also the only one that can handle the full range of relational database management system functions. It can handle the full range of relational database management system functions, and it is the only one that can handle the full range of relational database management system functions.

IBM's DB2 database management system is widely regarded as the most powerful and flexible relational database management system available today. It is also the most widely used relational database management system in the world. Cullinet posts quarterly loss

By Christine Whelan

WESTWOOD, Mass. — Formerly the financial star of the mainframe software industry, Cullinet Software, Inc. last week reported its second straight quarterly loss on sales that dropped 21% from year-earlier levels.

Citing an unexpected slowdown in European sales, Cullinet reported a loss of \$6.9 million, or 19 cents per share, on revenue of \$34.2 million for its second quarter, which ended Oct. 31.

In the year-earlier period, the firm earned \$3.6 million, or 12 cents per share, on \$43.2 million in sales.

Brian Mutert, an analyst with San

Francisco-based Robertson, Colman and Stephens, said the mainframe data base management market continues to be soft, especially outside the U.S.

"The sales of Applied Data Research, Inc. continue to disappoint Ameritech corporate management, and Software AG of North America results are still softer than expected for mainframe systems," Mutert noted.

Cullinet President and Chief Executive Officer David Chapman said the firm has substantially completed its sales and support staff hiring in the U.S. but continues to hire in those areas overseas.

Software Research future uncertain; investors may sell firm, source code

By Stanley Gibson

NATICK, Mass. — Uncertainty about the future of Software Research Corp. (SRC), a company specializing in networking software, is leaving some of the company's customers in doubt about their investments.

Former SRC employees said the company's venture capital investors may be preparing to sell the company or at least the source code for SRC's software. They said they anticipate a resolution of SRC's situation this week.

"Last week our technical rep called to say he had been laid off. We are totally taken aback," said an MIS executive at a major insurance company being used as a beta-test site for SRC's Electronic Office Interchange (EOI) software.

"It seems a little strange," the user continued. "We were about to begin a beta test with EOI next week."

The user said their account representative told them that SRC's venture capitalists are concerned about the company and that SRC may not support EOI.

"Luckily, we are not terribly dependent on it," the user said.

Calls to SRC were referred to the company's president, Martin Waters, who could not be reached for comment.

EOI is the electronic mail component of the company's main product, Strategic Network Environment, which is software that allows Digital Equipment Corp., Wang Laboratories, Inc. and IBM computers to communicate with one another. EOI is said to connect DEC's All-in-1, Wang Office and IBM's Professional Office System.

According to several former employees, SRC laid off some 30 workers on Nov. 14. The company had two earlier rounds of layoffs this year (CW, July 14). Together, the layoffs have reduced the firm's work force by more than half the original total of 125.

Founded in 1976, SRC has received \$11 million in venture capital since 1984. Its principal investors are Eastech Management Co. of Boston and New York-based Welch, Carson, Anderson & Stowe.

ing done by his father in the past year.

"Dr. Wang can now step back up to his pedestal, which I think is positive," said George Colony, president of Cambridge, Mass., research firm Forrester Research, Inc. "To have Fred in charge of operations now is a step forward."

However, Colony voiced a concern about Fred Wang repeated by many observers and Wang insiders (CW, Sept. 3) — the company's ability to recruit top management talent with its strong orientation around the Wang family.

Other observers agree with Fred Wang that the company's biggest problem is market perception. "They are still seeking credibility in a marketplace that is very different from the one in which they were successful," said Amy Wohl, president of Wohl Associates in Bala-Cynwyd, Pa. "More and more of the office-systems buying decisions are being made by DP managers who don't have that much familiarity with Wang."

Timeplex offers investors reason to give thanks

During the upcoming holiday, investors in Timeplex, Inc. (TIX — 204) will have reason to give thanks.

In the last eight weeks, the price of Timeplex shares has surged more than 30%. Analysts believe several recent developments affecting the data communications supplier should sustain its stock's strong move.

Timeplex's key product area is its Link Family of network resource managers that operate mainly over T1 transmission facilities. T1 lines are terrestrial digital circuit lines that transmit at a rate of 1.54M bit/sec. According to Alexa

McCloughan, analyst with Goldman, Sachs & Co., "Timeplex dominates the market for T1 multiplexing equipment, which, with annual shipment growth exceeding 30%, is one of the fastest growing segments in the data communications industry."

At a Nov. 10 meeting for securities analysts, Timeplex discussed several developments that analysts say further strengthen the company's position.

First, AT&T reduced its tariff on T1 transmission lines for distances exceeding 1,000 miles by 40%, a move likely to stimulate demand for T1 equipment. Second, Timeplex disclosed that it raised prices by 14% in early September on all T1 multiplexers and products sold domestically. Despite the price hike, orders in September and October were reportedly above expectations.

Greg Francfort, securities analyst with First Boston Corp., says Timeplex recognizes the possibility that current strong orders may be bor-

rowing from business in the second half of its fiscal year, ending June 30, 1987. "As a precaution, the company is trying to control expenses now," he observes.

The company's stock repurchase plan is also an important factor. Since July, Timeplex has bought back roughly 5% of its outstanding shares and can repurchase up to 500,000 additional shares before July 1987. Analysts consider such a buy-back program significant because it offsets the dilution in per-share earnings that would result from exercising stock options or converting the company's bond issue into common stock.

"These new variables have certainly warranted Timeplex's stock move," says Jon Gruber, senior partner with Montgomery Securities. Gruber, who has recommended purchase of Timeplex since it traded at 18, says he expects further boosts in the stock price when the company reports strong December quarter results and begins its delivery of its new Link/2 resource manager, which is currently under beta test.

Analysts estimate Timeplex will earn between \$1.30 and \$1.40 per share in fiscal 1987, compared with \$1.09 per share in 1986. Thomas Linkas of Goldman, Sachs says, "Timeplex should deliver sequentially higher sales and earnings over the balance of fiscal 1987, given the impressive new product flow and the company's momentum in T1 wire-line equipment."

"Despite Timeplex's impressive recent stock performance, the stock is still undervalued," Francfort of First Boston says. According to Francfort, investors are concerned that the market for T1 equipment will not grow as fast as projected, and Timeplex's share will suffer as competition intensifies.

"I'm optimistic about the market since it has protected leading T1 suppliers from generally soft industry conditions," Francfort says.

"Also, with a large installed base to generate recurring revenue and a strong service organization in place, Timeplex has advantages over many competitors of being a much larger and more stable company."

Porteus is president of Strand Research Associates, a Centerville, Mass.-based company that provides customized research services for financial and high-tech firms.

Fred Wang succeeds father

From page 102

for gaps in its product line and weak field support. "I will be addressing the general perception issues that lag the reality," he said. "I want to make sure that our strategy is understood."

All signs have pointed to Wang as the heir apparent to his father since the 1985 resignation of former President John Cunningham, who took over the helm of Computer Consoles, Inc. between Cunningham's departure and Fred Wang's promotion. An Wang returned to a much more active role in running the company.

An Wang, 66, retains the titles of chairman and chief executive officer and has no plans to retire, a company statement said. He will oversee Fred Wang and other members of the corporate staff, while Fred Wang will take over most of the customer visit-

Paradyne cutbacks trim 280 jobs

By James A. Martin

LAROC, Fla. — Paradyne Corp., in an effort to cut costs and operating losses, said last week it was laying off 280 employees at its headquarters here.

The troubled data communications vendor said reducing its work force by 8% will help cut 1987 spending by about \$9 million. Paradyne recently announced a third-quarter net loss of \$18.6 million, compared with a loss of \$6.3 million during the same quarter last year.

"This is what the textile industry calls 'cutting the cloth to fit the pattern,'" said Irwin Silberberg, an analyst with Silberberg Rosenthal in

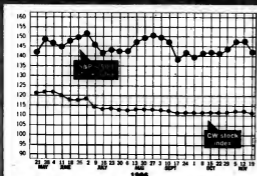

New York. "They should have made these cuts a long time ago, but I guess they were hoping for an upturn, and they're now having to adjust their expense level so they can make a profit with the current level of revenues."

Paradyne has faced a number of obstacles in the past year, including a federal grand jury indictment accusing the company of fraud, a U.S. Customs Service investigation into the company's export practices and the closing of a Puerto Rico plant that employed 165 workers.

Legal expenses related to the fraud case totaled \$657,000 during the third quarter ended Oct. 31.

INSTANT ANALYSIS

"Japanese firms have virtually ignored the anti-dumping elements of this agreement since it was signed nearly four months ago."

—Irvin Feldman, Semiconductor Industry Association board chairman and president

and CEO of Memorex, Inc., on the July U.S.-Japan trade agreement

Fred Wang succeeds father

Reorganizes sales division during first day as president

By Clinton Wilder

LOWELL, Mass. — A long-expected industry succession became official last week when Frederick A. Wang was named president of Wang Laboratories, Inc. by his father and the company's founder, An Wang.

With his new position, Fred Wang, 36, adds the company's worldwide sales, marketing and service organizations to his current responsibilities for manufacturing, treasury and research and development. He will retain the title of treasurer.

On his first day as president, Wang announced a major executive reorganization of the firm's sales organization, naming Ian Diery senior vice-president of U.S. sales and marketing.

Diery, head of Wang sales in Europe, replaces Robert L. Doretti, who was named to the new post of senior vice-president for corporate and marketing communications.

Wang said his biggest challenges will be "spreading the message to customers" that Wang Laboratories has the products in place to offer data processing solutions. He was between customer calls in Pennsylvania when interviewed by *Computerworld* last week.

Fred Wang

"When I was younger, I knew that this was the type of role I would like to play in the company," he said of the president's position. "I always hoped they would put me in the positions that are most useful to the company, and I think I am the right person for the right spot."

Wang Labs has yet to recover from its devastating slump in 1985, and Wang believes the company is unfairly saddled with a reputation

Toshiba, Motorola join forces

By Takahiko Kondo

TOKYO — Toshiba Corp. is negotiating a deal with Motorola, Inc. to establish a joint venture in Japan in early 1997 to build and market microprocessors and super-memory chips.

Under the agreement, Schaumburg, Ill.-based Motorola is offering to separate its Memory Division and establish a new firm to be jointly run by Toshiba. Toshiba will be investing approximately \$186 million in the venture.

Toshiba would not divulge details of the talks, which reportedly began at Motorola's request earlier this year. Production under the agreement would focus on the 1M-bit dynamic random-access memory (DRAM) chip. Also targeted would be 32-bit microprocessors.

Industry observers believe Motorola sought the arrangement in an attempt to complement its relatively weak memory sector. Toshiba is one of the leading ven-

dors of 1M-bit dynamic RAM chips.

Motorola would offer a reliable source of microprocessor expertise to Toshiba, helping to diversify its microchip business. Motorola's 1995 semiconductor revenue, reaching \$1.73 billion, came largely from discrete chips and microprocessors.

While the other recession-hit Japanese chip vendors — including NEC Corp., Hitachi Ltd. and Fujitsu Ltd. — elected to scale down their semiconductor production this year, Toshiba alone is stepping up both manufacturing and production and exports, projecting a 1996 semiconductor output valued at \$2.7 billion.

A source close to Toshiba noted that the joint venture would be targeted at the Japanese and South Asian markets. Toshiba is expected to use its own domestic sales channels for Japanese markets.

Separately, Japanese semiconductor maker Mitsubishi Electric Corp. an-

INDUSTRY INSIGHT
Bob Quinterio

Software prices rising up curve

For centuries, people believed the world was flat. Now we are equally convinced it is round. A similar phenomenon is discernable in the computer industry.

For decades, people believed the money was in hardware. Now we are about to change our minds about that, too.

No wonder everybody got the impression that it was the hardware that mattered. Not long ago, the software was free, whereas the hardware was very expensive. Now the tables are turning. In some cases, IBM's systems software fees alone, not to mention the cost of application programs, are already comparable to the prices of hardware.

One can naturally wonder, therefore, whether we may see the day when the vendors start giving free hardware in order to attract users to their expensive software.

Take the intermediate systems market, for example. At the start of the decade, the 4341 Model 2 was IBM's largest mid-size 870-architecture mainframe. The state-of-the-art operating system was DOS/VSE, whose price accounted for about 9% of a user's total three-year operating costs.

Today, the 4381 Model 14 has the pole position among IBM's mid-size CPUs. The DOS users are being lured by IBM to migrate to MVS/XA through such special offerings as the XA Ex-

Ashton-Tate diversifications help third-quarter profit jump

By James A. Martin

TORRANCE, Calif. — Ashton-Tate continued along a strong growth pattern, according to financial results released last week. The application software vendor posted third-quarter earnings of \$7.9 million, up 66% from the \$4.8 million reported for the same quarter last year.

The increase was attributed to the success of Ashton-Tate's Dbase III Plus data management application and the company's continued diversification into new markets, according to industry analysts.

"The micro market has been accelerating lately, and that's a big plus for all leading micro software companies," said William Shattuck, soft-

ware analyst with San Francisco-based Montgomery Securities. "In addition, the data base software market for micros has not been penetrated as spreadsheet and word processing have, and more and more users are requiring those kind of sophisticated programs."

Although Ashton-Tate can expect a growth rate of up to 70% for fiscal 1996, that rate is expected to drop to 30% next year, in line with the micro software market, Shattuck said. However, if the company continues to acquire, as it has with Multimate International Corp. and Decision Resources, Inc., then its growth rate will remain higher than average.

HP gains in fourth quarter

Sees 15% rise in sales, 23% climb in earnings

By James A. Martin

PALO ALTO, Calif. — Hewlett-Packard Co. last week concluded its fourth quarter and 1995 fiscal year with modest gains in sales and income.

Fourth-quarter sales were \$1.93 billion, a 15% increase from the \$1.7 billion recorded during the same quarter in 1995. Net earnings were \$167 million, or 62 cents per share, a 23% rise from \$127 million, and 50 cents per share, a year ago.

Separately, the company said it has become a shareholder in Microelectronics and Computer Technology Corp., an Austin, Texas, research

consortium. HP acquired the share previously owned by BMC Industries, Inc. in St. Paul, Minn.

HP closed the books on fiscal 1995 with sales of \$7.1 billion, compared with \$6.5 billion in fiscal 1994. Earnings were \$510 million, or \$2.02 a share, compared with \$483 million and \$1.91 a share.

"Overall, it was a disappointing year, and the company has not really grown much in the past two years," said Richard C. Bily, microcomputer analyst with Gartner Securities in Stamford, Conn. "Their growth has been less than 20% in the past two years, and their computer line is rather aged."

The company also said it began shipping the HP 9000 Model 540, one month ahead of schedule.

THE MARRIAGE THAT CHANGED THE SOFTWARE INDUSTRY.

In an industry that's had its share of volatility, we present an ideal partnership.

On one side of the aisle, McCormack & Dodge. A fast-growing software company known for its leading edge technology.

On the other, Dun & Bradstreet. Employer of four U.S. presidents, a symbol of financial stability for nearly a century and a half.

They exchange vows, and you've got the

kind of company the business software market has been waiting for.

A software company that's not only rich in talent. But rich in resources.

Resources to train, support and service. Resources to fix a problem no matter where in the world it occurs.

Resources to fund serious long-term R&D in every field of business software. Financial, manu-

facturing, human resources, application development tools.

Backed by Dun & Bradstreet, today's McCormack & Dodge combines stability and innovation. Something no other software company has managed to do.

If you're planning on a new family of software, isn't this the kind of company you want to marry?

McCormack & Dodge

a company of
The Dun & Bradstreet Corporation
